**Grusza**

**Wojśławice, 2021**

*Pyrus* sp. , Gardno

**Pyrus** L. 1753 – Grusza, rodzina Rosaceae – różowatych

Krusza – Bułgaria, Paræ – Dania, Norwegia, Birne – Holandia, Pear – Francja, Pera – Włochy, Peer – Niderlandy, Gruszka – Polska, Grusha – Rosja, Pera – Hiszpania, Hruška – Czechy, Słowacja; Përon – Szwecja, Pear – Anglia, Pereira – Portugalia, Barne – jidysz, Kruszka – Serbia, Armut – Turcja, Grusza – Ukraina, Białoruś; Nok – Uzbekistan, Gyllygen – Walia. Langas – Malta, Krysza – Macedonia, Bumbieris – Łotwa, Dardhë – Albania, Kruška – Bośnia, Chorwacja; Pirn – Estonia, Päärynä – Finlandia, Achladi (αχλάδι) – Grecja, Mskhali (მსხალი) – Gruzja, Madari – baskijski, Almurut (алмырут) – Kirgizja, Kriaušė – Litwa

*Pyrus 'nn'* z *Vespa crabro*

Do rodzaju należy 60 gatunków, występujących w Eurazji i północno-zachodniej Afryce. Są to drzewa lub krzewy często z ciernistymi pędami. Liście mają całobrzegie lub piłkowane, nie klapowane. Kwiaty są miododajne. Owoce gruszkowatego kształtu. Miąższ zwykle z licznymi komórkami kamiennymi. Wytrzymałość na mrozy jest u grusz na ogół wysoka. Wymagają gleb dość żyznych, gliniastych lub gliniasto-piaszczystych. Są także gatunki, jak nasza rodzima grusza pospolita – *Pyrus pyraster*, o skromnych wymaganiach glebowych. Wszystkie grusze wymagają pełnego nasłonecznienia, niektóre są bardzo wytrzymałe na suszę i na zanieczyszczenia powietrza, w tym także na związki siarki (!). Nasza grusza pospolita, zwana także gruszą polną, gruszą dziką, „ulegalką”, „pierziołką”, „odleżałką”, „gniłką” rośla w lasach liściastych na nasłonecznionych polanach i na ich skraju, ale od południowej strony. Była związana z polskim krajobrazem, z naszymi polami i z naszą miedzą. Jest niestety już wielką rzadkością. Szkoda, że odchodzi w zapomnienie dawny piękny polski krajobraz.

W botanicznym horoskopie galijskim gruszy nie uwzględniono. Dziwne, bo przecież Galia, jak długa i szeroka, szumiała gruszkami. To na dawnych jej obszarach, we Francji i w Belgii, wyhodowano w XVII i XVIII wieku najwięcej szlachetnych odmian.

*Pyrus calleryana* 'Chanticleer' – Grusza drobnoowocowa 'Chanticleer'

Odmiana została znaleziona w 1950 roku. na ulicach Vlevelend w Ohio i wprowadzona do handlu 1965 roku przez „Scamlon Nursery”. Jest to małe drzewo o regularnym, stożkowatym pokroju. Dorasta do około 10 metrów wysokości i 5 metrów szerokości. Liście ma sezonowe, ciemnozielone, błyszczące, jajowate i niezbyt liczne. Przebarwiają się jesienią na pomarańczowe, purpurowe i szkarłatne oraz długo pozostają na drzewie. Kwitnie w maju i w czerwcu. Kwiaty są liczne, białe pokrywają, jak u grusz, całe drzewo. Owoce są małe, nieliczne, dekoracyjne, ale niesmaczne i nie zachęcające do jedzenia. Mrozoodporna do minus 29 °C i tolerancyjna na zanieczyszczenie, zasolenie i alkaliczne gleby. W Arboretum Wojsławice w uprawie od 2005 r. Jest to jedna z najlepszych i najcenniejszych odmian do zieleni miejskiej, szczególnie do obsadzania ulic w dużych aglomeracjach wiejskich.

***Pyrus communis* L.** – Grusza pospolita (grusza polna, grusza dzika, gruszka, kreszka, kryszka, ulęgałka, pierdziołka, odleżałka, gniłka)

Występuje w Europie, poza rejonami północnymi i północno-wschodnimi, w północno-zachodniej Afryce i zachodniej Azji. Zasięg jest trudny do ustalenia, ze względu na krzyżowanie się z różnymi formami uprawnymi. Jest drzewem powoli dorastającym do 20 m wysokości, o gęstej, kulistej lub szerokostożkowatej koronie, z odrostami korzeniowymi. Pędy ma długie, silnie cierniste, szarooliwkowe z połyskiem, początkowo z włoskami, później nagie. Kora jest szara. Liście ma sezonowe, okrągławe lub jajowate do 6 cm długości, sztywne i błyszczące. Ogonek liściowy jest do 6 cm długi, cienki, w różnym stopniu pokryty włoskami ale nigdy filcowato. Jesienią przebarwiają się na żółto i czerwono, po opadnięciu czernieją. Kwitnie w kwietniu i maju. Kwiaty są śnieżnobiałe, zebrane po 3–9 w niewielkich baldachogronach i pachną nieprzyjemnie trimetylamina. Owoce ma we wrześniu i październiku, od 1,5 do 3 cm średnicy, kuliste lub gruszkowate, na cienkim ogonku do 4 cm długim, zielonożółte z brązowymi kropkami, bez czerwonego rumieńca (!). Są jadalne po „ulęczeniu”, najlepiej w sianie lub sieczce. Bardzo mrozoodporna powyżej minus 29 °C (USDA 4). Jest światłolubna i ciepłolubna, odporna na suszę i skażenie powietrza, tolerancyjna co do gleby. Dobrze rośnie także na glebach wapiennych. Jest to drzewo bardzo malownicze w okresie kwitnienia, jesienią i w stanie bezlistnym. Doskonałe do zadrzewień rekultywacyjnych i tworzenia ochronnych pasów w rejonach przemysłowych i przy autostradach, cenne w naszym krajobrazie, jako „grusza polskiej miedzy”, doskonałe do zadrzewień śródpolnych – ulubione miejsce gniazdowania wielu ptaków. Żyje od 150 do 200 lat. Jej drewno jest wielce cenione przy wyrobie różnych urządzeń i przymiarów, które nie „paczą” się i „trzymają wymiar”.

Grusze „przydrożne” przy trasie Niemcza–Strzelin

*Pyrus* 'Gellerts BB'*Pyrus* 'Beurré Alexandre Lucas'*Pyrus* 'Concorde'*Pyrus* 'Williams Christ'***Pyrus salicifolia* 'Pendula'** – Grusza wierzbolistna 'Pendula'

Drzewo do 3–4 m szerokości i podobnej wysokości ze zwisającymi, cienkimi pędami. Młode pędy często z cierniami, gęsto, filcowato srebrzystoszaro owłosione, jesienią i w zimie nagie. Liście sezonowe, wąskie, lancetowate do 3–7 cm długości, jak u wierzby. Młode z obydwu stron srebrzystoszaro owłosione, starsze tylko od spodu. Kwitnie razem z listnieniem w kwietniu, maju. Kwiaty białe w niewielkich kwiatostanach. Owoce małe, gruszkowate, na krótkich szypułkach, zielone, twarde i aromatyczne. Najczęściej szczepiona na niskiej podkładce z gruszy pospolitej. Bardzo mrozoodporna, powyżej minus 29°C (USDA 4). W Arboretum Wojśławice w uprawie od 2005 roku.

**Tab. 185. Wykaz gatunków i odmian różnych proveniencji żywych roślin z rodzaju *Pyrus* – Grusza uprawianych w Arboretum Wojsławice dla zachowania różnorodności botanicznej i w gotowości do badań w 2017/2018 r. (za [www.arboretumwojslawice.pl](http://www.arboretumwojslawice.pl) )**
