National Park Service  
Natural Resource Stewardship and Science  
Fort Collins, Colorado

The National Park Service, Natural Resource Stewardship and Science office in Fort Collins, Colorado, publishes a range of reports that address natural resource topics of interest and applicability to a broad audience in the National Park Service and others in natural resource management, including scientists, conservation and environmental constituencies, and the public.

The Natural Resource Technical Report Series is used to disseminate results of scientific studies in the physical, biological, and social sciences for both the advancement of science and the achievement of the National Park Service mission. The series provides contributors with a forum for displaying comprehensive data that are often deleted from journals because of page limitations.

All manuscripts in the series receive the appropriate level of peer review to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and designed and published in a professional manner. This report received informal peer review by subject-matter experts who were not directly involved in the collection, analysis, or reporting of the data.

Views, statements, findings, conclusions, recommendations, and data in this report do not necessarily reflect views and policies of the National Park Service, U.S. Department of the Interior. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the U.S. Government.

This report is available from the Northern Colorado Plateau Network website, <http://www.nature.nps.gov/im/units/ncpn>, as well as at the Natural Resource Publications Management web site, <http://www.nature.nps.gov/publications/nrpm>.

# Executive Summary

In late 2008 and early 2009, the National Park Service (NPS) published a series of annotated vascular plant species checklists for each of the 16 park units in the Northern Colorado Plateau Network (NCPN). These reports were based on reviews of existing herbarium collections and field work associated with rare plant surveys, weed monitoring, vegetation mapping, and general floristic studies conducted from 2004 to 2007.

Since the appearance of these annotated checklists, additional studies have taken place in all 16 network parks, resulting in the discovery of new plant species in each park unit. This report summarizes all of the new species discoveries and changes in status made in each NCPN park from 2008 to 2011.

In just four years, nearly 700 changes to park checklists have been necessary to keep up with new research. Since 2008, 432 new vascular plant species have been added to the floras of the 16 NCPN units. Zion National Park has seen the greatest increase, with 83 new plant taxa, followed by Dinosaur National Monument (57), Pipe Spring National Monument (56), and Bryce Canyon National Park and Cedar Breaks National Monument (both with 41). Over this same time period, the status of another 102 species has been changed. In most cases, species that were formerly classified as reported or historical in a park have been rediscovered and verified by a specimen, photograph, or confirmed observation (although this list also includes a small number of species shown to be falsely reported on further examination). All told, 534 changes have been made to the annotated checklists of the 16 network parks in the last four field seasons (2008–2011). In addition, recent nomenclatural changes have affected 48 Utah species represented by 159 park records.

# Acknowledgements

We would like to thank Northern Colorado Plateau Network (NCPN) program manager Dustin Perkins and the University of Wyoming's Gary Beauvais for securing funding for this project through the Rocky Mountain Cooperative Ecosystem Studies Unit. The following botanists, ecologists, naturalists, curators, students, and friends helped with field work or graciously shared their findings: Arvid Aase, Brian Black, Hondo Brisbin, Jonathan Carvella, Debi Clark, Janet Coles, Trista Crook, Cheryl Decker, Josh Ducette, Laura Fertig, Brian Franzone, Tony Frates, Giuliana Gabbato, Amy Gaienne, Fred Govedich, William Gray, Brian Hadley, Wendy Hodgson, Noel Holmgren, Pat Holmgren, Pete Hoyt, Sophia Kast, Ken Kingsley, Clay Kyte, Jenny Leasor, Peter Lesica, Becca Lieberg, Katrina Lund, Margaret Malm, Steve McKee, Mark Miller, Ryan Meszaros, Kezia Nielsen, Douglas Reynolds, Glenn Rink, Paul Roelandt, Charlie Schelz, Donna Shorrock, Joel Silverman, Stephanie Stewart, Amy Tendick, Joel Tuhy, Amber Van Alfen, Vicki Webster, Rebecca Harms Weissinger, Pete Williams, and the Fall 2011 Plant Anatomy and Diversity class from Southern Utah University (David Dodds, Sonia Flores, Shay Hunt, Katie Jackson, Michelle Kersiek, Makoto Kobayashi, Derek Lloyd, Dillon Monroe, Wendy Murray, Kaelyn Ward, and Sterling Young). Our apologies (and thanks) to anyone inadvertently left off of this list.

We would like to dedicate this publication to the memory of Ann Elder (Dinosaur NM) and Chris Nickel (Hovenweep NM), who helped with many phases of the botanical inventory work in the Northern Colorado Plateau Network.

# 1 Introduction

In late 2008 and early 2009, the National Park Service (NPS) published a series of annotated vascular plant species checklists for each of the 16 park units in the Northern Colorado Plateau Network (NCPN) (Fertig 2009a, 2009b, 2009c, 2009d, 2009e, 2009f; Fertig and Alexander 2008, 2009; Fertig and Atwood 2009; Fertig and Kyte 2009; Fertig and Topp 2009; Fertig et al. 2009a, 2009b; Hogan et al. 2009a, 2009b, 2009c). These reports were based on reviews of existing herbarium collections and field work associated with rare plant surveys, weed monitoring, vegetation mapping, and general floristic studies conducted from 2004 to 2007.

Since the appearance of these annotated checklists, additional studies have taken place in all 16 network parks, resulting in the discovery of new plant species in each park unit. In 2008 alone, 62 new species were documented in nine NCPN parks (Fertig 2008; Fertig et al. 2009c), while another 51 new species were discovered in 2009 (Fertig et al. 2010). In addition, nearly two dozen species previously listed as historical (not seen since 1970) or reported (without a voucher) have been relocated and confirmed as present since 2008.

New discoveries continued in 2010 and 2011. This report summarizes all of the new species discoveries and changes in status made in each NCPN park from 2008 to 2011. In a departure from previous addenda, we have organized new species reports individually by park. We have also included a revised summary table for each park that provides statistics on the number of species confirmed and reported, as well as the numbers of taxa based on life form (e.g., trees, shrubs, perennial forbs, annual grasses) and geographic range patterns (e.g., introduced, local endemic, peripheral, widespread).

## 2 Methods

### 2.1 Status

The status of a species can change based on new information. Using the NPS technical series annotated checklists (see Chapter 5) as a baseline, we were able to determine whether species found during field surveys or cited in recent literature were new to a park or represented a change in status (such as a species formerly considered historical or reported). Additional species reports and supporting data (herbarium specimens, photographs, or location information) were generously provided by park and network biologists and outside researchers. Whenever possible, new specimens were corroborated by one of the authors or an outside expert. Changes in species status (see Table 2-1) were made to a master spreadsheet database and summarized for each park.

### 2.2 Nomenclature

Species nomenclature for this update follows the most current identification manual for each state (Weber and Wittmann 2001 for

Colorado parks, Welsh et al. 2008 for Arizona and Utah parks, Dorn 2001 for Wyoming parks). The original annotated checklists for the 11 Utah park units were based on an earlier edition of *A Utah Flora* (Welsh et al. 2003). The appropriate corrections in nomenclature were made in the 2009 addendum (Fertig et al. 2009c) and are included in Appendix A. Unfortunately, no single reference yet covers the entire flora of the Southwest or intermountain region. Specialists may be disappointed in how their favorite taxonomic group is treated by current state floras. The decision to follow state floras was made at the outset of this project in 2004, in the belief that park staff and researchers would be most familiar with the names and taxonomic concepts being applied at the state level. Future name changes, reduction of species to synonymy, elevation of varieties to full species status, and alteration in family concepts will need to be addressed, especially as the *Intermountain Flora* and *Flora of North America* are completed and can be adopted as alternatives to state-based floras.

**Table 2-1. Categories and descriptions of park status for plant species.**

Number	Category	Description
I	Present in park	Species has been documented as occurring in a park based on a corroborated herbarium specimen (voucher) or photograph taken from within park boundaries since 1970. The species is still presumed to be extant in the park.
II	Present (observed)	Species has been observed within the park since 1970 and the location documented, but a voucher or photograph has not been taken (usually the plant is in too poor of a condition to be vouchered). Species is still presumed to be extant in the park.
III	Extripated	Species has been collected, photographed, or observed in the park during the past, but has been confirmed to be extirpated.
IV	Historical	Species has been documented in the park with a corroborated herbarium specimen, but has not been observed or relocated since before 1970. It is not known if the species has been extirpated in the park.
V	Reported	Species has been cited as occurring in the park by a reliable literature source, but has not yet been confirmed with a voucher specimen or photograph. Reports are considered reliable if the park is within the expected range of the species or has suitable habitat, or the species is unlikely to be mistaken for another taxon already documented from the area.
VI	False Report	Species has been previously reported for a park in the literature or based on an herbarium specimen, but has been demonstrated to be misidentified.
VII	Questionable	Species has been reported for a park in the literature, but the park is outside of its expected range or lacks suitable habitat, or a more probable look-alike species is already known. No vouchers exist to corroborate presence or a misidentification.
VIII	Potential	Species could occur within the park based on its known distribution or the presence of suitable habitat, but has not yet been documented.

### 3 Results

This chapter summarizes results for each of the 16 network parks. Tables summarizing changes in the flora of each park unit are organized alphabetically by family and species. Additional information is provided on syn-

onyms, common name, life form, geographic range, park status, population size, data source (literature reference or herbarium specimen with collector, collection number, and repository), year documented, and other comments. The tables utilize the following abbreviations (Table 3-1):

**Table 3-1. Key to abbreviations in summary tables.**

Abbreviation	Full name	Description
Life form (Life form)		
AnnF	Annual forb	Non-woody, broad-leaved plants that complete their life cycle in one year
AnnG	Annual graminoid	Grass-like plants that complete their life cycle in one year
Fern	Ferns and fern-allies	Non-flowering vascular plants that reproduce by spores
PerF	Perennial forb	Non-woody, broad-leaved plants that live for multiple years
PerG	Perennial graminoid	Grass-like plants that live for multiple years
Shrub	Shrub	Woody perennials with one to many trunks and usually less than 3.5 m tall
Tree	Tree	Woody perennials with a single stem or trunk over 3.5 m tall
Geographic range (Range)		
Disj	Disjunct	Taxa with their in-state distribution separated from their main, contiguous range by a gap of more than 800 km or 500 miles
Intro	Introduced	Non-native or exotic
LocEn	Local endemic	Taxa with their entire global range restricted to an area of less than 16,500 square km or 1 degree of latitude × 2 degrees of longitude
Periph	Peripheral	Taxa that are widespread globally but occur at the margin of their contiguous range within a state
RegEn	Regional endemic	Taxa with a global range of 16,500–250,000 square km (an area about the size of the state of Wyoming)
Wide	Widespread	Taxa have global ranges exceeding 250,000 square km and occur over at least 10% of the state
Park status (Status)		
FalsRep	False report	
Hist	Historical	
Po	Potential	
Pres	Present in park	See Table 2-1 for descriptions.
Pres (obs)	Present (observed)	
Rep	Reported	
Quest	Questionable	
Population size (Pop size)		
Abund	Abundant	Taxa with large populations, a broad ecological amplitude and dominant in one to several vegetation types, or occurring extensively across a park unit
Com	Common	Taxa with large local populations that may be restricted to a single vegetation type or do not occur across the entire park unit
Rare	Rare	Taxa with low population numbers and restricted to a single location
Unc	Uncommon	Taxa with low to medium-sized populations, a narrow ecological amplitude, or small range across the park unit
Unk	Unknown	Data lacking, usually applied only to reported species

### 3.1 Arches National Park

Since 2008, thirty new vascular plant species have been confirmed or reported for Arches National Park (ARCH) (Tables 3-2, 3-3). These new discoveries were made by park staff, the NCPN vegetation mapping crew (Coles et al. 2009a), and other researchers (Weissinger et al. 2011). Only seven of the new taxa have been verified with herbarium specimens or photographs, while 23 are based on unvouchered reports. Three new species are non-native—pale madwort (*Alyssum alyssoides*), English plantain (*Plantago lanceolata*), and ditch polypogon (*Polypogon interruptus*)—but none is considered noxious by the State of Utah. At least nine of the newly reported species were previously on the park's potential species list (Fertig et al. 2009a). The most notable addition to the flora of ARCH is the Cisco mariposa (*Calochortus ciscoensis*), a species newly described by Welsh and others (2008) from a type specimen near Cisco, north of the park (Figure 3-1). With these new discoveries, the confirmed and reported flora of ARCH now stands at 551 taxa, an increase of 5.5% since 2007 (Table 3-4).

Alcove rock-daisy (*Perityle specuicola*) was formerly considered present in ARCH, but has now been dropped to the falsely reported list (Table 3-3). This species is known from

Figure 3-1. Cisco mariposa (*Calochortus ciscoensis*), newly described by Stanley Welsh and colleagues in 2008 and endemic to northeast Utah and adjacent Colorado. This species was first documented in Arches National Park in 1953, but was included within sego lily (*C. nuttallii*). Both mariposa species are now known from the park. Cisco mariposa can be distinguished from sego lily by its solid white or pinkish petals, which lack a conspicuous, purple triangular patch above the nectary near the inner base of the petal. Photo by W. Fertig from just north of ARCH, May 2010.

cliffs on the south and east side of the Colorado River, just outside the park. A collection from this area by former Southeast Utah Group (SEUG) biologist Charlie Schelz had been mistakenly attributed to ARCH. Potential habitat for this species may exist along cliffs on the north side of the river (within the park), but the species should not be considered a member of the park's flora until these areas are surveyed.

The “Sleepy Hollow vine,” first reported for ARCH in 2009 (Fertig et al. 2010, p. 12), has been relocated and observed to be locally abundant, but has not yet been found in flower. Based on a reexamination of the material collected by SEUG biologist Mary Moran, it is now thought to represent western hedge-bindweed (*Calystegia sepium* var. *angulata*, rather than maurandya (*Maurandya antirrhiniflora*).

Six additional species reported by Coles and others (2009a) without vouchers are considered questionable here. Each is either well out of its known range, found in habitats not present in ARCH, or probably confused with a look-alike species already known from the park. These taxa include:

- *Asclepias involucrata* (Asclepiadaceae): report probably based on *A. macrosperma*
- *Artemisia ludoviciana* var. *latiloba* (Compositae): montane variety, probably mistaken for *A. ludoviciana* var. *ludoviciana*
- *Grindelia aphanactis* (Compositae): previous reports based on misidentified specimens of *G. fastigiata*
- *Psoralidium junceum* (*Psoralea juncea*) (Leguminosae): outside expected range
- *Calochortus flexuosus* (Liliaceae): outside expected range; report probably based on *C. ciscoensis*
- *Cryptogramma crispa* (*C. acrostichoides*) (Polypodiaceae): suitable habitat not present in ARCH

**Table 3-2. New vascular plant taxa confirmed or reported for Arches National Park, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Caprifoliaceae (Adroxaceae)	<i>Sambucus racemosa</i>	red elderberry	Shrub	Wide	Rep	Unk	Reported by Weissinger and others (2011).
Caryophyllaceae	<i>Stellaria longifolia</i>	long-leaved starwort	PerF	Sparse	Rep	Unk	Coles and others (2009a). Usually occurs at higher elevations—report may be questionable.
Compositae (Asteraceae)	<i>Artemisia tridentata</i> var. <i>wyomingensis</i> ( <i>Seriphidium tridentatum</i> var. <i>wyomingense</i> )	Wyoming big sagebrush	Shrub	Wide	Rep	Unk	Coles and others (2009a). Previously on potential list.
Compositae (Asteraceae)	<i>Chaenactis douglasii</i> (Includes vars. <i>douglasii</i> & <i>montana</i> )	hoary dusty-maiden	PerF	Wide	Rep	Unk	Coles and others (2009a). Previously on potential list.
Compositae (Asteraceae)	<i>Grindelia squarrosa</i>	curly-cup gumweed	PerF	Wide	Rep	Unk	Coles and others (2009a). Variety not indicated, most likely var. <i>serrulata</i> . Previously on potential list.
Compositae (Asteraceae)	<i>Haplopappus acaulis</i> ( <i>Stenotus acaulis</i> )	stemless goldenweed	PerF	Wide	Rep	Unk	Coles and others (2009a). Variety not indicated. Somewhat out of range, could be mistaken for <i>H. armerioides</i> .
Compositae (Asteraceae)	<i>Iva axillaris</i>	poverty-weed	PerF	Wide	Rep	Unk	Coles and others (2009a). Previously on potential list.
Compositae (Asteraceae)	<i>Machaeranthera canescens</i> var. <i>aristata</i>	aristate aster	PerF	RegEn	Rep	Com	Coles and others (2009a). Previously on potential list.
Compositae (Asteraceae)	( <i>M. linearis</i> , <i>M. rigida</i> , <i>Dieteria canescens</i> var. <i>aristata</i> )						
Tetradymia canescens		spineless horsebrush	Shrub	Wide	Rep	Unk	Coles and others (2009a).
*Convolvulaceae	<i>Calystegia sepium</i> var. <i>angulata</i>	western hedge bindweed	PerF	Wide	Pres	Rare	Moran photo (Fertig et al. 2009c, p. 12).
Cruciferae (Brassicaceae)	<i>Alyssum alyssoides</i>	pale madwort	AnnF	Intro	Rep	Unk	Coles and others (2009a). Native to Europe.
Cruciferae (Brassicaceae)	<i>Arabis holboellii</i> var. <i>brachycarpa</i> ( <i>A. divaricarpa</i> , <i>A. confinis</i> , <i>Boechera brachycarpa</i> , <i>B.</i> <i>divaricarpa</i> )	spreadingpod rockcress	PerF	Wide	Rep	Unk	Coles and others (2009a).

Table 3-2. New vascular plant taxa confirmed or reported for Arches National Park, 2008–2011, cont.

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Cruciferae (Brassicaceae)	<i>Descurainia pinnata</i>	western tansy-mustard	AnnF	Wide	Rep	Com	Coles and others (2009a). Variety not cited, most likely var. <i>intermedia</i> or <i>osmiorum</i> (both previously on potential list).
Cruciferae (Brassicaceae)	<i>Lepidium lasiocarpum</i>	hairy-pod pepperwort	AnnF	Wide	Rep	Unk	Coles and others (2009a). Variety not cited, but most likely var. <i>georginum</i> .
Cruciferae (Brassicaceae)	<i>Physaria newberryi</i>	Newberry's twinpod	PerF	RegEn	Rep	Unk	Coles and others (2009a). Previous reports from ARCH have all been misidentified.
Cyperaceae	<i>Scirpus validus</i> ( <i>Schoenoplectus</i> <i>tabernaemontani</i> , Sch. <i>lacustris</i> var. <i>validus</i> )	soft-stem bulrush	PerG	Wide	Rep	Unk	Coles and others (2009a). Previous reports from ARCH have all been misidentified.
Fagaceae	<i>Quercus × eastwoodiae</i>	Eastwood's oak	Shrub	RegEn	Rep	Unk	Coles and others (2009a) as <i>Q. havardii</i> × <i>gambelii</i> .
Gramineae (Poaceae)	<i>Elymus lanceolatus</i> ( <i>Agropyron dasystachyum</i> )	thickspike wheatgrass	PerG	Wide	Rep	Unk	Coles and others (2009a).
Gramineae (Poaceae)	<i>Festuca ovina</i>	sheep fescue	PerG	Wide	Rep	Unk	Coles and others (2009a). Variety not indicated.

### **3.2 Black Canyon of the Gunnison National Park**

Eleven new species have been documented or reported for Black Canyon of the Gunnison National Park (BLCA) since 2008 (Table 3-5). These taxa were all documented by NCPN staff working on the park's vegetation classification (Coles et al. 2010). Crustweed (*Glyptopleura marginata*), in the sunflower family, was also reported as new for the park in 2009 (Fertig et al. 2010), but has since been shown to be a misidentified specimen of dwarf lousewort (*Pedicularis centranthera*, a species already documented in the park flora) (Table 3-6). With these additions, the known and reported flora of BLCA now stands at 543 taxa (Table 3-7), an increase of 2.1% since 2007.

Coles and others (2010) cite 10 additional species for the flora of BLCA that were listed as falsely reported by Hogan and others (2009b, Appendix C as “NCPN (in ed.”). These species are all unlikely to occur in BLCA due to a lack of suitable habitat, or the park being well outside of their known or expected range. None of these taxa has been vouchered, so positive confirmation is lacking.

David Svendson, of the NCPN data management team, noted the following errors in the annotated checklist for BLCA (Hogan et al. 2009b):

- *Grindelia squarrosa* var. *squarrosa* (Asteraceae): change to var. *serrulata*
- *Leucantha cyanus* (Asteraceae): should be spelled *Leucacantha cyanus*
- *Ligularia bigelovii* var. *hallii* (Asteraceae): delete variety
- *Boechera demissa* var. *demissa* (Brassicaceae) should be dropped from the potential list (Appendix B)
- *Descurainia pinnata* ssp. *incisa* (Brassicaceae) should be *Descurainia incisa* ssp. *incisa*
- *Sambucus microbotrys* var. *micobotrys* (Caprifoliaceae): delete variety
- *Vicia americana* var. *americana* (Fabaceae): delete variety
- *Persicaria maculata* (Polygonaceae): should be spelled *Persicaria maculosa*
- *Ranunculus inamoenus* var. *inamoenus* (Ranunculaceae): delete variety

This table updates Table 3.1 from Hogan and others (2009b) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Weber and Wittenmann (2001).

### 3.3 Bryce Canyon National Park

In the past four years, wetland vegetation surveys by Terri Hildebrand and students from Southern Utah University and the NCPN vegetation mapping team (Tendick et al. 2011a) have netted 41 new vascular plant species for Bryce Canyon National Park (BRCA) (Table 3-8). Another three species previously reported for the park have now been confirmed with voucher specimens (Table 3-9). At least 26 of the new records for BRCA are based on species previously on the park's potential species list (Fertig and Topp 2009, Appendix B). Among the new species are two non-native taxa: blue mustard (*Chorispora tenella*) and bulbous bluegrass (*Poa bulbosa*). The latter species is rapidly expanding in southern Utah and can be extremely invasive. It is of potential management concern and difficult to eradicate because it reproduces by root offsets and asexual bulblets. The flora of BRCA now stands at 628 taxa (Table 3-10), an increase of 7% since 2007.

Tendick and others (2011a) cite the following 11 species as also occurring in the park. We consider these species questionable, as BRCA lacks suitable habitat, is located well outside their known distribution, or more plausible look-alike species are already known from within the park. Four of the taxa were previously listed as "falsely reported" (Fertig and Topp 2009, Appendix C) and none has been vouchered from the park. The rejected species include:

- *Cryptantha osterhoutii* (Boraginaceae): well out of expected range; more likely to be *Cryptantha abata*, *C. humilis*, or *C. ochroleuca*
- *Arenaria fendleri* var. *fendleri* (Caryophyllaceae): previous reports were based on *A. fendleri* var. *glabrescens*
- *Physaria newberryi* (Cruciferae): all previous reports based on *P. intermedia* or *P. rubicundula*; may also represent *P. chambersii* var. *membranacea*
- *Carex geyeri* (Cyperaceae): outside expected range
- *Carex raynoldsii* (Cyperaceae): outside expected range
- *Gentianella amarella* (Gentianaceae): previous reports based on *G. heterosepala*
- *Stipa neomexicana* (Gramineae): unlikely due to lack of suitable habitat
- *Smilacina racemosa* (Liliaceae): outside expected range
- *Zigadenus venenosus* (Liliaceae): outside expected range; probably *Z. paniculatus*
- *Salix glauca* (Salicaceae): outside expected range; suitable habitat probably not present
- *Cymopterus acaulis* (Umbelliferae): outside expected range; reports more likely to be *Cymopterus minimus* or *C. purpureus*.

### 3.4 Canyonlands National Park

National Park Service staff scientists and other researchers (Tendick et al. 2012 in prep.) have added 33 plant species to the known flora of Canyonlands National Park (CANY) since 2008 (Table 3-11). At least 16 of those species were previously listed as “potential” for the park (Fertig et al. 2009b, Appendix B). Another four species that were formerly reported for the park (without vouchers) have since been confirmed as being present (Table 3-12). One of the new species records, pepperwort, (*Marsilea vestita*) represents a new family (Marsileaceae) for the park. With these additions, the flora of CANY now stands at 627 confirmed and reported species (Table 3-13), an increase of 5.6% over the last four years.

The NCPN vegetation mapping team has reported another 30 species for CANY that are considered questionable here (Tendick et al. 2012 in prep.). These taxa (listed below) are excluded primarily because CANY lacks suitable habitat or is outside the species’ predicted range. Herbarium vouchers or photographs are needed to confirm their presence in the park.

- *Lithospermum multiflorum* (Boraginaceae): suitable habitat not present; report probably based on *L. incisum*
- *Tiquilia hispidissima* (Boraginaceae): synonym of *Tiquilia latior*
- *Opuntia whipplei* (Cactaceae): difficult to mistake, though CANY is outside expected range; confirmation needed
- *Symporicarpos oreophilus* (Caprifoliaceae): suitable habitat largely absent
- *Arenaria fendleri* var. *fendleri* (Caryophyllaceae): outside expected range; reports probably based on var. *eastwoodiae*
- *Corispermum villosum* (Chenopodiaceae): Previous reports (Albee et al. 1988) are now thought to represent *C. americanum* (already on CANY present list)
- *Antennaria parvifolia* (Compositae): previous reports based on *A. marginata*; suitable habitat probably lacking
- *Brickellia grandiflora* (Compositae): suitable habitat probably lacking; report may be based on *B. californica*

- *Erigeron uintahensis* (Compositae): outside of expected range; suitable habitat lacking
- *Haplopappus acaulis*: (Compositae) outside expected range; reports probably based on *H. armerioides*
- *Hymenoxytis acaulis* var. *arizonica* (Compositae): previous reports based on var. *ivesiana*
- *Machaeranthera canescens* var. *glabra* (Compositae): included in *M. canescens* var. *aristata* by Welsh and others (2008)
- *Arabis hirsuta* (Cruciferae): outside expected range
- *Chamaesyce albomarginata* (Euphorbiaceae): outside expected range; report probably based on *C. fendleri*
- *Calamagrostis canadensis* (Gramineae): suitable habitat not present; probably based on *C. scopulorum*
- *Elymus spicatus* (Gramineae): suitable habitat lacking
- *Festuca ovina* (Gramineae): suitable habitat lacking
- *Poa annua* (Gramineae): outside expected range; suitable habitat lacking
- *Stipa lettermanii* (Gramineae): outside expected range; suitable habitat lacking
- *Swertia albomarginata* (Gentianaceae): previous reports based on *S. utahensis*
- *Astragalus convallarius* var. *convallarius* (Leguminosae): somewhat out of range; report more likely to be *A. episcopus*
- *Psoralidium tenuiflorum* (Leguminosae): cited as questionable (Fertig et al. 2009b)
- *Zigadenus elegans* (Liliaceae): usually a montane species; previous reports have all been *Z. vaginatus*
- *Ipomopsis congesta* (Polemoniaceae): previous reports based on *I. pumila*
- *Phlox austromontana* (Polemoniaceae): previous report based on *P. hoodii*
- *Amelanchier alnifolia* (Rosaceae): previous reports based on *A. utahensis*
- *Peraphyllum ramosissimum* (Rosaceae): usually a montane species, confirmation needed

- *Potentilla biennis* (Rosaceae): previous reports based on *P. paradoxa*; outside expected range
- *Populus angustifolia* (Salicaceae): usually found in montane habitats; reports may be based on *P. × intercurrens*
- *Penstemon barbatus* (Scrophulariaceae): suitable habitat not present.

**Table 3-11. New vascular plant taxa confirmed or reported for Canyonlands National Park, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Cactaceae	<i>Opuntia fragilis</i>	brittle prickly-pear	PerF	Wide	Pres	Unc	Hodgson 23988 DES (2009). Previously on falsely reported list.
Chenopodiaceae	<i>Chenopodium desiccatum</i> ( <i>C. pratericola</i> )	desert goosefoot	AnnF	Sparse	Rep	Unk	Tendick and others (2012). Previously on potential list.
Chenopodiaceae	<i>Chenopodium rubrum</i> var. <i>rubrum</i>	red goosefoot	AnnF	Wide	Pres	Unk	Moran & Miller s.n. CANY (2010).
Chenopodiaceae	<i>Suaeda calceoliformis</i>	broom seepweed	AnnF	Wide	Rep	Unk	Tendick and others (2012).
Compositae (Asteraceae)	<i>Bidens frondosa</i>	devil's beggarsticks	PerF	Wide	Pres	Unc	Moran & Miller s.n. CANY (2010). Previously on potential list.
Compositae (Asteraceae)	<i>Artemisia tridentata</i> var. <i>wyomingensis</i> ( <i>Seriphidium tridentatum</i> var. <i>wyomingense</i> )	Wyoming big sagebrush	Shrub	Wide	Rep	Unk	Tendick and others (2012). Previously on potential list.
Compositae (Asteraceae)	<i>Chrysothamnus pulchellus</i> var. <i>baileyi</i> ( <i>C. baileyi</i> , <i>Ericameria pulchella</i> )	pretty rabbitbrush	Shrub	Periph	Rep	Unk	Tendick and others (2012). Previously on potential list.
Compositae (Asteraceae)	<i>Chrysanthemus viscidiflorus</i> var. <i>lanceolatus</i>	lanceleaf rabbitbrush	Shrub	Wide	Rep	Unk	Tendick and others (2012). Previously on potential list.
Compositae (Asteraceae)	<i>Cirsium undulatum</i> var. <i>undulatum</i>	wavy-leaved thistle	PerF	Wide	Pres	Unc	Moran s.n. CANY (2011). Previously on falsely reported list.
Compositae (Asteraceae)	<i>Grindelia aphanactis</i> ( <i>G. nuda</i> var. <i>aphanactis</i> )	Rydberg's gum-weed	PerF	Periph	Pres	Rare	Rink 4613 NAU (2005). Previously on falsely reported list.
Compositae (Asteraceae)	<i>Helianthus anomalus</i> (Includes <i>H. deserticola</i> )	sand sunflower	AnnF	RegEn	Rep	Unk	Tendick and others (2012). Previously on potential list.
Cruciferae (Brassicaceae)	<i>Alyssum alyssoides</i>	pale madwort	AnnF	Intro	Rep	Unk	Tendick and others (2012). Previously on falsely reported list. Native to Europe.
Cyperaceae	<i>Carex hystricina</i>	bottlebrush sedge	PerG	Wide	Pres	Unc	Moran s.n. CANY (2011). Previously on potential list.
Euphorbiaceae	<i>Chamaesyce serpyllifolia</i> ( <i>Euphorbia serpyllifolia</i> )	thyme-leaved spurge	AnnF	Wide	Pres	Unc	Harms s.n. NAU (2003). Previously on potential list.
Fagaceae	<i>Quercus × eastwoodiae</i>	Eastwood's oak	Shrub	RegEn	Rep	Unk	Tendick and others (2012). Previously on potential list. Hybrid of <i>Quercus gambelii</i> × <i>Q. Welshii</i> .
Gramineae (Poaceae)	<i>Alopecurus aequalis</i>	shortawn foxtail	PerG	Wide	Pres	Unc	Moran & Miller s.n. CANY (2011).

This table updates Table 3.1 from Fertig and others (2009b) and Table 4 from Fertig and others (2009c) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.5 Capitol Reef National Park

Fieldwork by NCPN vegetation mappers (Clark et al. 2009) and other researchers since 2008, and a review of recent literature (Clark 2009), have added 22 new vascular plant species to the flora of Capitol Reef National Park (CARE) (Table 3-14). Of the new species, six have been confirmed with vouchers and 16 are reported. Eleven of the new reports were species previously considered falsely reported and five were on the park's potential species list (Fertig 2009a, Appendix C and B). One other species formerly cited as reported has now been confirmed as present (Table 3-15). With the addition of these new species, the documented and reported flora of CARE is now 909 taxa (Table 3-16). This represents an increase of 2.5% from the flora known in 2007.

Only two new exotic species have been added to the flora over the last four years. Of these, meadow fescue (*Festuca pratensis*) has the greatest potential to become invasive, especially in riparian areas.

Two of the new native species for the park are local endemics of the San Rafael Swell. Bolander's camissonia *Camissonia bolanderi* was recently described as a new species to science by Atwood and Welsh (2007). A duplicate of a Ken Heil collection from CARE housed at the Brigham Young University herbarium has been annotated as *C. bolanderi* (Welsh et al. 2008). The status of this species remains poorly known, and it has recently been added to the Utah state sensitive plant list of the Bureau of Land Management. Johnston's cryptanth (*Cryptantha johnstonii*) had previously been documented for the park but specimens in the CARE herbarium appeared to be misidentified (Fertig 2009a, Appendix C). Debi Clark includes this species in her recent book *Capitol Reef Wildflowers* (Clark 2009), with a note that it is "found in the northern portion of the park on gypsum soils with well-developed biological soil crusts." She also includes a photo, though the image shows a flowering plant and not the diagnostic fruits. Better confirmation of this report is still needed.

Several additional species reported for CARE by the NCPN vegetation mapping group (Clark et al. 2009) have been excluded here because the park lacks suitable habitat,

is well outside the known or expected range of the species, or a more probable look-alike species is already known. Until vouchers are secured to corroborate their presence, the status of these species should be considered questionable. These taxa include:

- *Coryphantha vivipara* var. *vivipara* (Cactaceae): more likely to be var. *arizonica*
- *Corispermum villosum* (Chenopodiaceae): more likely to be *C. americanum*
- *Erigeron annuus* (Compositae): outside of expected range
- *Tetradymia nuttallii* (Compositae): outside of expected range; previous reports have been *T. spinosa*
- *Xylorhiza glabriuscula* (Compositae): outside of expected range; more likely to be *Xylorhiza confertifolia* or *X. venusta*
- *Ephedra nevadensis* (Ephedraceae): previous reports have been *E. viridis* var. *viridis*; somewhat out of range
- *Arctostaphylos pungens* (Ericaceae): outside of expected range; more likely to be *A. patula*
- *Nama demissum* (Hydrophyllaceae): outside of expected range; report may be based on *N. retrorsum*
- *Sisyrinchium halophilum* (Iridaceae): well outside of expected range; probably misidentified *S. demissum*
- *Astragalus castaneiformis* (Leguminosae): well outside of expected range; previous reports all based on *A. consobrinus*
- *Allium textile* (Liliaceae): unlikely; readily confused with *A. macropetalum*
- *Ipomopsis congesta* var. *congesta* (Polemoniaceae): outside of expected range; report may be based on var. *frutescens*
- *Phlox muscoides* (Polemoniaceae): commonly mistaken for *Leptodactylon caespitosum*
- *Eriogonum corymbosum* var. *revealianum* (Polygonaceae): previous reports all based on the recently described var. *heilii*
- *Eriogonum maculatum* (Polygonaceae): well outside of expected range

- *Fragaria vesca* (Rosaceae) outside of expected range; report probably based on *F. virginiana*
- *Penstemon latus* (Scrophulariaceae): outside expected range
- *Penstemon strictiformis* (Scrophulariaceae) outside expected range; previous reports all based on *P. scariosus* var. *scariosus*.

In addition, four species included in Clark (2009) have been excluded. Mojave woody-aster (*Xylorhiza tortifolia*) is now considered a Mohave endemic and known only from the St. George area in Utah (Welsh et al. 2008). The photo in Clark's book depicts hurtleaf

woodyaster (*X. imberbis*; *X. tortifolia* var. *imberbis*), a species already documented for the park. The photo of Hopi-tea (*Thelesperma megapotamicum*) in the book appears to be a rayless form of scapose greenthread (*T. subnudum* var. *subnudum*), which is also already known from CARE. Otherwise, *T. megapotamicum* is out of range in south-central Utah. Fendlerbush (*Fendlera rupicola*) and creeping rush-pea (*Caesalpinia repens*) are both included in the book, though the text correctly notes that they have not been documented from the park itself. A careless reader could be confused into thinking they are members of the park flora.

**Table 3-14. New vascular plant taxa confirmed or reported for Capitol Reef National Park, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Boraginaceae	<i>Cryptantha johnstonii</i>	Johnston's cryptanth	PerF	LocEn	Rep	Unk	Clark (2009) includes a photo and reports species from N end of park. All previous herbarium specimens observed at CARE have been misidentified (previously falsely reported). Confirmation needed (photo from Clark 2009 not definitive).
Cactaceae	<i>Opuntia erinacea</i> ( <i>O. polyacantha</i> var. <i>erinacea</i> )	common prickly pear	PerF	Wide	Rep	Unk	Clark and others (2009). Variety not indicated. Previously on potential list.
Caryophyllaceae	<i>Arenaria hookeri</i> var. <i>desertorum</i> ( <i>Eremogone hookeri</i> )	Hooker's sandwort	PerF	RegEn	Pres	Unk	Clark (2009) photo from N end of park. Previously on potential list.
Chenopodiaceae	<i>Atriplex rosea</i>	tumbling orach	AnnF	Intro	Rep	Unk	Clark and others (2009). Previously cited as falsely reported based on misidentified specimens in CARE herbarium. Native to Eurasia.
Compositae (Asteraceae)	<i>Balsamorhiza sagittata</i>	arrowleaf balsamroot	PerF	Wide	Rep	Unk	Clark and others (2009).
Compositae (Asteraceae)	<i>Prenanthes exigua</i> ( <i>Lygodesmia exigua</i> )	prenanthes	AnnF	Wide	Pres	Rare	Topp s.n. CARE (2010). Previously on potential list.
Cyperaceae	<i>Scirpus validus</i> ( <i>Schoenoplectus</i> <i>tabernaemontani</i> , Sch. <i>lacustris</i> ssp. <i>validus</i> )	soft-stem bulrush	PerG	Wide	Rep	Unk	Clark and others (2009). Previously cited as falsely reported based on misidentified specimens in CARE herbarium.
Fagaceae	<i>Quercus × eastwoodiae</i>	Eastwood's oak	Shrub	RegEn	Rep	Unk	Clark and others (2009) as <i>Q. havardii</i> × <i>gambelii</i> . Previously cited as falsely reported.
Gramineae (Poaceae)	<i>Festuca ovina</i> var. <i>ingrata</i> ( <i>F. idahoensis</i> )	Idaho fescue	PerG	Wide	Rep	Unk	Clark and others (2009).
*Gramineae (Poaceae)	<i>Festuca pratensis</i> ( <i>Lolium pratense</i> , <i>Schedonorus pratensis</i> )	meadow fescue	PerG	Intro	Pres	Unc	Weissinger 06290901 CARE (2009). Previously on falsely reported list. Native to Eurasia.
Gramineae (Poaceae)	<i>Phalaris arundinacea</i> ( <i>Phalaroides arundinacea</i> )	reed canary grass	PerG	Wide	Pres	Unc	Ducette JD08071101 (2011).
Gramineae (Poaceae)	<i>Stipa nelsonii</i> ( <i>Achnatherum nelsonii</i> , <i>S. columbiana</i> var. <i>nelsonii</i> )	Nelson's needlegrass	PerG	Wide	Rep	Unk	Clark and others (2009). Previously cited as falsely reported based on misidentified specimens in CARE herbarium.

**Table 3-14. New vascular plant taxa confirmed or reported for Capitol Reef National Park, 2008–2011, cont.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Leguminosae (Fabaceae)	<i>Astragalus miser</i>	weedy milkvetch	PerF	Wide	Rep	Unk	Clark and others (2009). Variety not indicated, but most likely var. <i>oblongifolius</i> . Previously cited as falsely reported based on misidentified specimens in CARE herbarium.
Leguminosae (Fabaceae)	<i>Lathyrus lanszwertii</i>	Lanszwert's sweetpea	PerF	Wide	Rep	Unk	Clark and others (2009). Variety not indicated, but most likely var. <i>laetivirens</i> .
Liliaceae (Alliaceae)	<i>Allium acuminatum</i>	taper-tip onion	PerF	Wide	Rep	Unk	Clark and others (2009).
Oleaceae	<i>Forestiera pubescens</i> (F. <i>neomexicana</i> )	desert olive	Shrub	Wide	Rep	Unk	Clark and others (2009). Previously on potential list.
*Onagraceae	<i>Camissonia bolanderi</i>	Bolander's camissonia	AnnF	LocEn	Pres	Rare	Heil 2743 CARE (1986). Newly described species, duplicate cited by Welsh and others (2008).
Pinaceae	<i>Abies concolor</i>	white fir	Tree	Wide	Rep	Unk	Clark and others (2009).
Polemoniaceae	<i>Linanthastrum nuttallii</i> ( <i>Leptosiphon nuttallii</i> , <i>Linanthus nuttallii</i> )	Nuttall's linanthus	PerF	Wide	Rep	Unk	Clark and others (2009). Previously cited as falsely reported based on misidentified specimens in CARE herbarium.
Polygonaceae	<i>Eriogonum salsuginosum</i> (Stenogonium <i>salsuginosum</i> )	smooth wild buckwheat	AnnF	Wide	Pres	Com	Topp s.n. CARE (2010). Previously on potential list.
Rosaceae	<i>Potentilla diversifolia</i>	wedgeleaf cinquefoil	PerF	Wide	Rep	Unk	Clark and others (2009). Variety not indicated, but probably var. <i>diversifolia</i> . Previously cited as falsely reported based on misidentified specimens in CARE herbarium.
Violaceae	<i>Viola canadensis</i> (V. <i>scopulorum</i> , V. <i>rydbergii</i> )	Canadian white violet	PerF	Wide	Rep	Unk	Clark and others (2009). Previously cited as falsely reported based on misidentified specimens in CARE herbarium.

\*Indicates species cited in previous updates by Fertig and others (2009c) or (2010).

This table updates Table 3.1 from Fertig (2009a) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.6 Cedar Breaks National Monument

Since 2008, a rare plant survey (Fertig and Reynolds 2009), general floristic survey (Fertig 2009g), and vegetation mapping study (Tendick et al. 2011b) have documented 41 new plant species for Cedar Breaks National Monument (CEBR) (Table 3-17). One taxon, *Zion jamesia* (*Jamesia americana* var. *zionis*), was removed from the flora (Table 3-18) after it was found that monument specimens were misidentified (Fertig and Reynolds 2009). Overall, the flora of CEBR has increased by 40 species (11.6%), to a current total of 385 taxa (Table 3-19). At least 27 of the new species were previously identified as potential or falsely reported for the monument (Fertig 2009b).

Among the noteworthy additions to the flora of CEBR over the last four years are first reports of rosy cliff jamesia (*Jamesia americana* var. *rosea*) for Utah (Fertig and Reynolds 2009), and three new families: Ephedraceae, Loasaceae, and Ophioglossaceae (Figure 3-2). One new local endemic, Tushar penstemon (*Penstemon caespitosus* var. *suffruticosus*), is now known from the bottom of Ashdown Canyon within the monument. Two additional non-native species have also been documented from the canyon bottom:

bull thistle (*Cirsium vulgare*) and prickly lettuce (*Lactuca serriola*). Neither is considered noxious by the State of Utah.

The adjacent Ashdown Gorge Wilderness Area of Dixie National Forest contains 308 vascular plant taxa (Fertig 2009g). In recent years, the Iron County Commission has discussed the potential of merging the wilderness area with CEBR to create a larger Cedar Breaks National Park. Though no action has been taken on this idea, the flora of CEBR would increase by 56 species if the two areas were merged (not counting 5 additional taxa from Ashdown Gorge recently reported for the monument by Tendick et al. 2011b) (Fertig 2009g).

Several additional species reported for CEBR by the vegetation mapping team (Tendick et al. 2011b) were not substantiated with voucher specimens and are here considered questionable. These are mainly species that are out of range, occur in habitats not found in CEBR, or are already represented in the flora by more plausible look-alikes. These taxa include:

- *Alnus incana* (Betulaceae): somewhat out of range; may be *Betula occidentalis*
- *Mertensia ciliata* (Boraginaceae): out of range; more likely to be *M. arizonica*, a very abundant look-alike species at CEBR
- *Erigeron canaanii* (Compositae): a Zion National Park and Navajo sandstone endemic that lacks suitable habitat in CEBR
- *Hieracium albiflorum* (Compositae): well out of range
- *Senecio crassulus* (Compositae): well out of range
- *Smilacina racemosa* (Liliaceae): out of range, more likely to be *S. stellata*
- *Rumex paucifolius* (Polygonaceae): out of range
- *Delphinium occidentale* (Ranunculaceae): all previous records based on *Aconitum columbianum*; more likely to be *D. barbeyi*
- *Ligusticum filicinum* (Umbelliferae): well out of range; probably *L. porteri*.

Figure 3-2. Moonwort (*Botrychium lunaria*), newly documented for Cedar Breaks National Monument from the north rim of the Cedar Breaks Amphitheater in August 2009. This species is the first member of the Ophioglossaceae (moonwort) family to be found in CEBR. Only one individual was observed and so it was photographed rather than collected. Photo by W. Fertig from Fertig (2009g).

**Table 3-17. New vascular plant taxa confirmed or reported for Cedar Breaks National Monument, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments

### 3.7 Colorado National Monument

The flora of Colorado National Monument (COLM) has not changed substantially since the annotated checklist of Hogan and others (2009a) was published. That report already incorporated new species observations by the NCPN vegetation mapping team (Von Loh et al. 2007). Some corrections to the checklist are provided in Fertig and others (2010).

In 2011, Katrina Lund documented two new species for the monument (Tables 3-20, 3-21). Compressed rush (*Juncus compressus*) was previously on the potential list, but has now been documented with a voucher specimen. White poplar (*Populus alba*) was formerly on the reported list, but is also now confirmed. These additions raise the number of species documented for COLM to 468 (Table 3-22).

**Table 3-20. New vascular plant taxa confirmed or reported for Colorado National Monument, 2008–2011.**

This table updates Table 3.1 from Hogan and others (2009a) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Weber and Wittman (2001).

### 3.8 Curecanti National Recreation Area

Since 2008, the NCPN vegetation mapping team (Tendick et al. 2010) has confirmed or reported 25 additional species for Curecanti National Recreation Area (CURE) (Table 3-23). Three other species that were previously reported have since been documented with a voucher (Table 3-24). These additions have increased the total number of confirmed and reported plant species from CURE to 704 taxa (Table 3-25). This number represents an increase of 3.7% in the total documented flora. At least seven of the new taxa were previously listed as potentially occurring in the recreation area (Hogan et al. 2009c).

Two errors have come to light since the original CURE checklist was published. The name *Lomatium triternatum* var. *platycarpum* (Apiaceae) should be changed to ssp. *platycarpum* to conform with the nomenclature of Weber and Wittman (2001). *Hippuris vulgaris* (Hippuridaceae) was incorrectly included in both Appendix A (confirmed species list) and Appendix B (potential species). This plant has been documented from the park, and so should be dropped from the potential list.

Tendick and others (2010) report several additional species for CURE which we consider questionable. These species (listed below) are not known from south-central Colorado, occur in habitats not found in the recreation area, or have probably been mistaken for more common species:

- *Yucca angustissima* (Agavaceae): not known from Colorado; report probably based on *Y. harrimaniae*
- *Cymopterus multinervatus* (Apiaceae): reports probably based on *C. constancei*
- *Asclepias involucrata* (Asclepiadaceae): outside expected range
- *Agoseris heterophylla* (Asteraceae): well outside expected range
- *Artemisia michauxiana* (Asteraceae): suitable habitat not present
- *Cirsium clavatum* var. *osterhoutii* (*C. araneans*) (Asteraceae): this Colorado endemic is listed as Historical by the Colorado Natural Heritage Program;

report probably based on *C. centaureae*, or miscoded *Cirsium arvense* (*Breea arvensis*)

- *Grindelia arizonica* (Asteraceae): outside of expected range; may be *G. squarrosa*
- *Heterotheca subaxillaris* (Asteraceae): outside of expected range
- *Packera tridenticulata* (*Senecio tridenticulatus*) (Asteraceae): more likely to be *Packera neomexicana*
- *Solidago nana* (Asteraceae) outside expected range
- *Solidago nemoralis* (Asteraceae): more likely to be *S. velutina*
- *Stenotus acaulis* (Asteraceae): more likely to be *S. armerioides*
- *Tetradymia nuttallii* (Asteraceae): well outside expected range
- *Townsendia strigosa* (Asteraceae): more likely to be *T. incana*
- *Oreocarya sericea* (*Cryptantha sericea*) (Boraginaceae: outside expected range
- *Schoenocrambe linearifolia* (Brassicaceae): report probably based on *S. linifolia*
- *Carex bebbii* (Cyperaceae): suitable habitat not present
- *Carex egglestonii* (Cyperaceae): suitable habitat not present
- *Thermopsis rhombifolia* (Fabaceae): more likely to be *T. montana*
- *Ribes coloradoense* (*R. laxiflorum*) (Grossulariaceae): previous reports based on *R. wolfii*
- *Juncus parryi* (Juncaceae): suitable habitat not present
- *Achnatherum robustum* (*Stipa robusta*) (Poaceae): outside expected range
- *Phlox condensata* (Polemoniaceae): suitable habitat not present
- *Phlox pulvinata* (Polemoniaceae): suitable habitat not present
- *Eriogonum umbellatum* var. *subaridum* (Polygonaceae): well outside expected range
- *Polygonum minimum* (Polygonaceae): outside expected range
- *Rumex salicifolius* var. *transitorius* (Polygonaceae): not known from Colorado;

- probably *R. triangulivalvis*
- *Oreobatus deliciosus* (*Rubus deliciosus*) (Rosaceae): outside of expected range
  - *Potentilla diversifolia* (Rosaceae): suitable habitat not present
  - *Salix lutea* (Salicaceae): outside expected range
  - *Castilleja rhexifolia* (Scrophulariaceae): suitable habitat not present
  - *Veronica scutellata* (Scrophulariaceae): outside expected range.

This table updates Table 3.1 from Hogan and others (2009c) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Weber and Wittman (2001).

### 3.9 Dinosaur National Monument

The NCPN vegetation mapping team has documented 55 new plant species for Dinosaur National Monument (DINO) (Coles et al. 2008a). Two additional species have been added for the monument flora since 1998 based on taxonomic revisions by Welsh and others (2008), and one taxon has been removed from the species list based on a misidentification (Tables 3-26, 3-27). As a result of these changes, the flora of DINO has shown a net increase of 56 plant species (6.5%) and now totals 812 confirmed and reported taxa (Table 3-28). Thirty-three of the new species were previously considered potential or falsely reported for the monument (Fertig 2009c).

The number of non-native species reported for DINO has increased by nine taxa due to the field work of Coles and others (2008a). Five of these new species are introduced forage or reclamations species: intermediate wheatgrass (*Elymus hispidus*), Russian wild-rye (*Elymus junceus*), chickpea milkvetch (*Astragalus cicer*), alsike clover (*Trifolium hybridum*), and red clover (*T. pratense*). One new exotic species, stork's bill (*Erodium cicutarium*), is listed as noxious by the State of Colorado.

Poison ivy (*Toxicodendron rydbergii*) was listed by Fertig (2009c) as historical in the monument, because it had not been relocated since before 1970. Coles and others (2008a) report this species for the monument, suggesting it is still extant. The plant's status has not been updated until its status can be confirmed with a voucher, photo, or more specific locality information.

Several additional species cited by Coles and others (2008a) are not included here. These species are excluded because DINO is outside of their known range, suitable habitat is lacking, or the identification is questionable. These species include:

- *Antennaria rosulata* (Compositae): well outside expected range; probably *A. dimorpha*
- *Artemisia spiciformis* (Compositae): outside expected range, habitat probably not present

- *Brickellia longifolia* (Compositae): outside expected range
- *Chrysanthemum nauseosus* var. *junceus* (Compositae): well outside expected range
- *Helianthus anomalous* (Compositae): well outside expected range; probably *H. petiolaris* ssp. *fallax*
- *Hymenoxys acaulis* var. *ivesiana* (Compositae): outside expected range
- *Solidago simplex* (*S. spathulata*) (Compositae): previous reports based on *S. nana*
- *Townsendia annua* (Compositae): outside expected range; report probably based on *T. incana*
- *Sedum debile* (Crassulaceae): outside expected range; report probably based on *S. lanceolatum*
- *Physaria newberryi* (Cruciferae): outside expected range; report may be based on *P. acutifolia*
- *Physaria reediana* (Cruciferae): previous reports based on *P. subumbellata*, true *P. reediana* is not known from Utah
- *Carex crawei* (Cyperaceae): outside expected range
- *Shepherdia rotundifolia* (Elaeagnaceae): outside expected range
- *Chamaesyce parryi* (Euphorbiaceae): well outside expected range; probably *C. glyptosperma* or *C. serpyllifolia*
- *Erioneuron pulchellum* (Gramineae): outside expected range
- *Poa leptocoma* (Gramineae): previous reports based on *Poa nervosa* × *P. pratensis* hybrids, confirmation needed
- *Stipa nelsonii* ssp. *dorei* (Gramineae): more likely to be var. *nelsonii*, confirmation needed
- *Juncus orthophyllus* (Juncaceae): Pacific Northwest species not known from Utah or Colorado
- *Habenaria hyperborea* (Orchidaceae): previous reports based on *H. zothecina*
- *Gilia scopulorum* (Polemoniaceae): Mohave species, outside expected range
- *Phlox pulvinata* (Polemoniaceae): suitable habitat probably not present

- *Eriogonum umbellatum* var. *subaridum* (Polygonaceae): outside expected range; more likely to be var. *aureum*
- *Physocarpus malvaceus* (Rosaceae): reports probably based on *P. alternans*
- *Purshia mexicana* var. *stansburyana* (Rosaceae): outside expected range, confirmation needed
- *Orthocarpus tolmiei* (Scrophulariaceae): outside expected range, more likely to be *O. luteus*
- *Penstemon paysoniorum* (Scrophulariaceae): Wyoming endemic, out of range.

**Table 3-26. New vascular plant taxa confirmed or reported for Dinosaur National Monument, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Asclepiadaceae	<i>Asclepias subverticillata</i> ( <i>A. galloides</i> )	whorled milkweed	PerF	Wide	Rep	Unk	Coles and others (2008a).
Cactaceae	<i>Coryphantha vivipara</i> ( <i>Escobaria vivipara</i> )	pincushion cactus	PerF	Wide	Rep	Unk	Coles and others (2008a). Variety not determined but most likely var. <i>vivipara</i> . Previously on potential list.
Cactaceae	<i>Sclerocactus whipplei</i> var. <i>roseus</i> ( <i>S. parviflorus</i> , <i>S. whipplei</i> ) var. <i>intermedius</i> )	small-flower fishhook cactus	PerF	Wide	Rep	Unk	Coles and others (2008a). Previously on potential list.
Caprifoliaceae (Adoxaceae)	<i>Sambucus racemosa</i>	red elderberry	Shrub	Wide	Rep	Unk	Coles and others (2008a). Variety not determined but most likely var. <i>microbotrys</i> .
Caryophyllaceae	<i>Silene antirrhina</i>	sleepy catchfly	AnnF	Wide	Rep	Unk	Coles and others (2008a).
Caryophyllaceae	<i>Silene menziesii</i> ( <i>Anotites menziesii</i> )	Menzies' campion	PerF	Wide	Rep	Unk	Coles and others (2008a). Previously on potential list.

This table updates Table 3.1-1 from Fertig (2009c) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.10 Fossil Butte National Monument

Since 2008, the NCPN vegetation mapping crew (Friesen et al. 2010) has added five new species to the flora of Fossil Butte National Monument (FOBU) (Table 3-29). Several additional species have been discovered or relocated during recent rare plant survey work (Fertig 2012 in prep.) and from the rediscovery of several unmounted specimens in the FOBU herbarium collected by retired monument naturalist Clay Kyte (Tables 3-29, 3-30). As a result of these studies, the number of plant species known from the monument has increased by eight (an increase of 1.5% since 2007). The total flora of FOBU now contains 554 confirmed or reported species (Table 3-31).

Several additional species reported by Friesen and others (2010) are not included in the current tally of FOBU's flora. Most of these species are considered questionable because the monument is well outside their likely range, suitable habitat is not present, or more likely look-alike species are already known from the area. To be accepted, these species need to be vouchered, photographed, or re-located. The questionable taxa include:

- *Amaranthus albus* (Amaranthaceae): previous reports have all been misidentified; more likely to be *A. blitoides*
- *Cymopterus lemmontii* (Apiaceae): outside expected range
- *Ligusticum porteri* (Apiaceae): outside expected range; reports are probably *L. filicinum*
- *Artemisia tripartita* (Asteraceae): outside expected range; reports probably based on *A. arbuscula*
- *Chaenactis stevioides* (Asteraceae): outside expected range; previous reports misidentified
- *Cryptantha cinerea* (Boraginaceae): outside expected range
- *Mertensia ciliata* (Boraginaceae): suitable habitat not present; more likely to be *M. oblongifolia*
- *Symporicarpos occidentalis* (Caprifoliaceae): previous reports based on *S. oreophilus*
- *Eremogone fendleri* (*Arenaria fendleri*) (Caryophyllaceae): outside expected range; reports probably based on *E. kingii*
- *Astragalus vexilliflexus* (Fabaceae): outside expected range
- *Hydrophyllum fendleri* (Hydrophyllaceae): outside expected range
- *Sisyrinchium montanum* (Iridaceae): outside expected range, previous reports based on *S. idahoense*
- *Epilobium anagallidifolium* (Onagraceae): outside expected range and lacking suitable habitat
- *Gayophytum ramosissimum* (Onagraceae): past reports based on *G. diffusum* var. *strictipes*
- *Plantago tweedyi* (Plantaginaceae): more likely to be *P. eriopoda*
- *Calamagrostis canadensis* (Poaceae): outside expected range; probably *C. inexpansa*
- *Poa glaucifolia* (Poaceae): more likely to be *P. arida*
- *Phlox caespitosa* (Polemoniaceae): outside expected range
- *Eriogonum flavum* (Polygonaceae): outside expected range
- *Eriogonum umbellatum* var. *subaridum* (Polygonaceae): variety not known from Wyoming
- *Talinum parviflorum* (Portulacaceae): outside expected range
- *Thalictrum fendleri* (Ranunculaceae): reports probably based on *T. occidentale*
- *Thalictrum venulosum* (Ranunculaceae): outside of expected range; report probably based on *T. occidentale*
- *Geum rossii* (Rosaceae): suitable alpine habitat not present in monument
- *Populus deltoides* var. *wislizenii* (Salicaceae): outside expected range of var. *wislizenii*; previous reports of var. *occidentalis* have not been corroborated.

This table updates Table 3.1 from Fertig and Kyte (2009) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Dorn (2001).

### 3.11 Golden Spike National Historic Site

Sarah Topp and Rebecca Weissinger visited Golden Spike National Historic Site (GOSP) in 2008 and documented five new species for the area. Three additional species were newly reported for GOSP based on the NCPN vegetation mapping project (Coles et al. 2011) (Table 3-32). Shadscale (*Atriplex confertifolia*), formerly on the reported list, has been corroborated with a voucher specimen (Table 3-33). Four species now on the confirmed or reported lists were previously

cited as potential for the park (Fertig 2009d). With these additions, the flora of GOSP now stands at 152 taxa (Table 3-34), an increase of 5.5% since 2007.

Coles and others (2011) also report small-flower globemallow (*Sphaeralcea parvifolia*) as new to GOSP. This species is closely related to Munro's globemallow (*S. munroana*) and replaces it in the Colorado Plateau. *S. parvifolia* is unlikely to be present in GOSP and reports are probably based on misidentified *S. munroana*.

**Table 3-32. New vascular plant taxa confirmed or reported for Golden Spike National Historic Site, 2008–2011.**

### 3.12 Hovenweep National Monument

SEUG biologist Mary Moran discovered five new native plant species for Hovenweep National Monument (HOVE) while conducting field surveys in 2010 (Table 3-35). In 2011, Tony Frates, of the Utah Native Plant Society, relocated small-flower fishhook cactus (*Sclerocactus whipplei* var. *roseus*) at the Square Tower unit of the monument and documented his find with a photo (Figure

3-3). This species had previously only been reported for the area (Table 3-36). With these new discoveries, the flora of HOVE has increased to 345 species (Table 3-37), which represents a 1.5% increase since 2007 (Fertig 2009e).

The results of the NCPN vegetation mapping group were previously incorporated into the monument's annotated checklist (Fertig 2009e, Von Loh et al. 2008).

Figure 3-3. Small-flower fishhook cactus (*Sclerocactus whipplei* var. *roseus*), photographed from Hovenweep National Monument in 2011 by Tony Frates.

**Table 3-35. New vascular plant taxa confirmed or reported for Hovenweep National Monument, 2010–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments

This table updates Table 3.1-1 from Fertig (2009e) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.13 Natural Bridges National Monument

Relatively little additional floristic work has taken place at Natural Bridges National Monument (NABR) since the publication of the annotated checklist in 2009 (Fertig 2009f). Work by the NCPN vegetation mapping group (Coles et al. 2008b) had been completed in time to be included in the 2009 checklist. Five species recognized by Coles and others (2008b) were considered questionable and are addressed in Appendix C of Fertig (2009f).

In 2009, Mary Moran of the Southeast Utah Group discovered the introduced grass yellow bluestem (*Bothriochloa ischaemum*) within NABR (Table 3-38). The following year, Mary relocated reddish monkeyflower (*Mimulus rubellus*) within the monument, changing its status from reported to present (Table 3-39). As a result of these discoveries, the flora of NABR has increased by just one species, to 429 (Table 3-40).

This table updates Table 3.1 from Fertig (2009f) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### **3.14 Pipe Spring National Monument**

Since 2008–2011, 56 new plant species have been documented as present or historical in Pipe Spring National Monument (PISP) (Table 3-41). Of these, 11 came from examination of specimens in the PISP herbarium that were not mounted or available when the 2008 annotated checklist was prepared (Fertig and Alexander 2008). The remaining 45 were collected or observed by Walter Fertig and Janet Coles during floristic or vegetation mapping surveys in 2008 and 2011 (Coles et al. 2008c, Fertig 2008). These surveys also resulted in the relocation and confirmation of 26 species previously reported (but not vouchered) for the monument and rediscovery of another 10 historical species (Table 3-42). As a result of these studies the known flora of PISP has increased from 277 to 330 species (Table 3-43), a net increase of 19%.

Among the newly documented species are 24 plant taxa cultivated in the monument's native peoples and pioneer garden. Another 11 non-native but naturalized species have been added to the flora, bringing the total number of introduced species to 93 (an increase of 60%).

Four new families are now represented in the PISP flora. These include the Pedaliaceae (sesame family), Santalaceae (sandalwood

family), Vitaceae (grape family), and Zannichelliaceae (horned pondweed family). The Pedaliaceae and Vitaceae are represented only by cultivated plants.

Four species that have been cited for PISP are now considered falsely reported. Historical records from the PISP herbarium for scarlet gaura (*Gaura coccinea*) and cushion milkwort (*Polygala subspinosa*) are based on specimens collected elsewhere in Arizona. Removal of *P. subspinosa* from the monument flora also results in the elimination of the Polygalaceae family. Two other specimens from the herbarium are misidentified: Fremont's goosefoot (*Chenopodium fremontii* var. *fremontii*) is actually silvery goosefoot (*Chenopodium fremontii* var. *incanum*), new to the monument, and Baker's cryptanth (*Cryptantha bakeri*) is Jones' popcornflower (*Plagiobothrys jonesii*) (Table 3-42).

Coles and others (2008c) reported one additional species for the monument flora (without a voucher) that is likely an error. The report of field mint (*Mentha arvensis*) is probably based on a misidentification of spearmint (*Mentha × spicata*), which is a conspicuous species at the West Cabin Spring and along the rock-lined overflow channel of the Castle pond. Both species are superficially similar and easily mistaken for the other.

**Table 3-41. New vascular plant taxa confirmed or reported for Pipe Spring National Monument, 2008–2011.**

This table updates Table 3.1 from Fertig and Alexander (2008) and Table 1 from Fertig (2008) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.15 Timpanogos Cave National Monument

Since 2008, the NCPN vegetation mapping group (Coles et al. 2009b) has added 10 new species to the flora of Timpanogos Cave Na-

tional Monument (TICA) (Table 3-44). All of these new taxa are unvouchered. The total number of species now recognized in the monument is 245 (Table 3-45), an increase of 4.3% from 2007 (Fertig and Atwood 2009).

**Table 3-44. New vascular plant taxa confirmed or reported for Timpanogos Cave National Monument, 2008–2011.**

Family	Species (Synonyms)	Common name	Life form	Range	Status	Pop size	Source (year)/Comments
Boraginaceae	<i>Lappula occidentalis</i> (L. redowskii var. <i>cupulata</i> , <i>L. marginata</i> , <i>L. texana</i> )	cupseed stickseed	AnnF	Wide	Rep	Unk	Coles and others (2009b). Probably var. <i>cupulata</i> . Previously on potential list.

This table updates Table 3.1 from Fertig and Atwood (2009) and reflects new species discovered or relocated from 2008 to 2011. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.16 Zion National Park

Since 2008, 83 new plant species have been documented for Zion National Park (ZION) (Table 3-46, Figure 3-4). Of these, 53 have been confirmed with voucher specimens or photographs, while 30 are reported from recent literature (Ott 2010). Another 16 species that had been known only from historical records have been relocated and 12 literature reports have been verified with new collections or photographs (Table 3-47, Figure 3-5). With these discoveries, the total confirmed and reported flora of ZION now stands at 1,074 taxa (Table 3-48), an increase of 8.5% (Fertig and Alexander 2009). ZION has surpassed Grand Staircase-Escalante National Monument as the Utah park with the highest vascular plant species richness (Fertig 2009h).

New species discoveries in ZION have come from a variety of sources. Current and former NPS employees in the vegetation, weed, and fire programs, including Cheryl Decker, Becca Lieberg, Kezia Nielsen, Brian Black, Joel Silverman, and Donna Shorrock, have added at least a dozen new species to the park flora. Ryan Meszaros, Brian Franzone, and fellow students from Northern Arizona University discovered or relocated nine taxa during research on fire ecology in the Crater Hill area of Zion (Fertig et al. 2010). Jeff Ott, a recent doctoral student from the University of North Carolina, added nearly 30 new reports through his tabulation of plot data and species lists from Harper (1993) and Cogan and others (2004). About two dozen new or rediscovered species reports have come from rare plant surveys (Fertig 2010a, 2011). Dedicated amateur botanists and vacationing scientists, such as Derrick Zobell, Margaret Malm, and Steve McKee, have also contributed a dozen new records.

Twenty-two new species documented since 2008 are exotic plants, giving the park 162 non-native species (Table 3-48). Although none of the new species is officially designated as a noxious weed by the State of Utah, several are of potential management concern, including giant reed (*Arundo donax*), Chilean chess (*Bromus trinii*), Himalayan blackberry (*Rubus discolor*), and grain sorghum (*Sorghum bicolor*). One of the newly documented introduced species, hemp (*Cannabis sativa*), has already been extirpat-

ed from the park due to the diligence of park staff. Most of the new weed species are appearing in recently burned areas, trailheads, campgrounds, or park housing.

Three newly discovered species from ZION are local or regional endemics that might warrant special management attention. Enterprise milkvetch (*Astragalus convallarius* var. *finitimus*) is restricted to the Kolob Terrace/Pine Valley Mountain area of Utah and adjacent Nevada. It was first discovered in the park in 2001, and a second site was found on Chinle soils bordering a small creek draining Smith Mesa in 2011. Sand dune nodding wild buckwheat (*Eriogonum cernuum* var. *psammophilum*) is a robust form of *E. cernuum* known from the East Entrance burn area and only described as a new taxon in 2008 (Welsh et al. 2008). Cedar Canyon pepperwort (*Lepidium montanum* var. *heterophyllum*) is endemic to south-central Utah and was discovered by Derrick Zobell in the Kolob area in 2010 (Figure 3-4). The abundance, distribution, potential threats, and management needs of each of these species is poorly known in the park and across their limited ranges.

The status of one of ZION's rarest plant species may need to be reassessed. Joel Tuhy, of the Utah Nature Conservancy, has questioned whether specimens of Paria breadroot (*Pediomelum pariense*) that he and other colleagues from Brigham Young University collected from the Checkerboard Mesa area in 1987 were actually taken from the park, or just outside of ZION on BLM lands (Tuhy personal communication, June 2011). These exposures of Carmel limestone should be revisited to determine whether this southern Utah endemic is actually part of the ZION flora.

An additional 45 species were reported for ZION by Ott (2010) without vouchers. For now, these species are considered questionable, because ZION is outside their known range, lacks suitable habitat, or other look-alike species are already present. Confirmation of these reports is needed with photos or corroborated vouchers:

- *Opuntia basilaris* (Cactaceae): all other reports are based on *O. erinacea* var. *aurea*

- *Artemisia arbuscula* (Compositae): report by Ott (2010) probably based on *A. nova*; outside expected range and suitable habitat not present
- *Chrysanthmnus nauseosus* var. *nauseosus* (*Ericameria nauseosa* var. *nauseosa*) (Compositae): outside expected range
- *Chrysanthmnus parryi* var. *parryi* (*Eri-cameria parryi* var. *parryi*) (Compositae): more likely to be var. *howardii* or *nevadensis*
- *Chrysanthmnus viscidiflorus* ssp. *axillaris* (Compositae): considered a synonym of var. *stenophyllus* by Welsh and others (2008)
- *Erigeron argentatus* (Compositae): questionable; more likely to be *E. utahensis*
- *Geraea canescens* (Compositae): outside expected range
- *Haplopappus laricifolius* (Compositae): outside expected range; more likely to be *H. linearifolius*
- *Heterotheca viscida* (Compositae): probably a typographical error and meant to be *H. villosa* (now *Chrysopsis villosa*); not known from Utah
- *Hypochaeris radicata* (Compositae): outside expected range; report may be based on *Taraxacum* or *Crepis* spp.
- *Lygodesmia juncea* (Compositae): previous reports have all been misidentified
- *Stephanomeria runcinata* (Compositae): outside expected range
- *Townsendia montana* (Compositae): suitable habitat probably lackisalix
- ng; outside expected range
- *Caulanthus cooperi* (Cruciferae): cited by Ott (2010), but suitable habitat probably lacking in ZION; report may be based on *Streptanthella longirostris*
- *Draba verna* (Cruciferae): previously cited as falsely reported; outside expected range; report may be based on misidentified *D. cuneifolia*
- *Carex geyeri* (Cyperaceae): previous reports from ZION have all been misidentified
- *Carex utriculata* (Cyperaceae) previous reports from ZION have all been misidentified
- *Scirpus americanus* (*Schoenoplectus americanus*) (Cyperaceae): report probably based on *S. pungens*
- *Swertia utahensis* (Gentianaceae): outside expected range; report probably based on *S. albomarginata*
- *Achnatherum contractum* (*Oryzopsis contracta*) (Gramineae): well outside expected range; probably based on *Stipa hymenoides* or a hybrid
- *Aristida purpurascens* (Gramineae): this Great Plains species is not known from Utah; report probably based on *A. purpureus*
- *Bromus vulgaris* (Gramineae): cited by Ott (2010), but outside known range
- *Elymus smithii* (*Pascopyrum smithii*) (Gramineae): previous reports based on *E. lanceolatus*
- *Festuca occidentalis* (Gramineae): outside expected range
- *Muhlenbergia wrightii* (Gramineae): previous reports have all been misidentified
- *Stipa viridula* (*Nassella viridula*) (Gramineae): outside expected range
- *Luzula campestris* (Juncaceae): outside expected range
- *Luzula parviflora* (Juncaceae): all previous reports have been based on misidentified *Juncus* spp.
- *Krameria* sp. (Krameriaceae): outside expected range; report probably based on *Coleogyne ramosissima*
- *Allium macropetalum* (Liliaceae): outside expected range
- *Streptopus amplexifolius* (Liliaceae): outside expected range
- *Sphaeralcea coccinea* (Malvaceae): previous reports have all been based on misidentified specimens
- *Phlox caespitosa* (Polemoniaceae): outside expected range
- *Phlox hoodii* (Polemoniaceae): previous reports all misidentified
- *Eriogonum flavum* (Polygonaceae) well outside known range; most likely *E. jamesii* var. *ruplicola*
- *Eriogonum heracleoides* (Polygonaceae): outside expected range

- *Salix ligulifolia* (Salicaceae): probably based on *S. eriocephala* var. *watsonii*
- *Castilleja flava* (Scrophulariaceae): previous reports all misidentified
- *Penstemon angustifolius* (Scrophulariaceae): outside expected range
- *Penstemon caespitosus* (including *P. tusharensis*) (Scrophulariaceae): lacking suitable habitat
- *Penstemon latus* (Scrophulariaceae): well outside expected range
- *Penstemon leonardii* (Scrophulariaceae): probably based on *P. higginsii*
- *Physalis heterophylla* (Solanaceae): outside expected range: report probably based on *P. hederifolia*
- *Typha angustifolia* (Typhaceae): previous reports from ZION all based on *T. domingensis*
- *Viola nuttallii* (Violaceae): well outside known range; reports may be based on *V. praemorsa*.

Figure 3-4. New plant species from Zion National Park. Clockwise from top left: upland yellow violet (*Viola praemorsa*), discovered from the Lava Point area and photographed by Derrick Zobell. Tall cinquefoil (*Potentilla arguta* var. *convallaria*), photographed by D. Zobell near Lava Point in 2011. Spiny goldenweed (*Haplopappus spinulosus* var. *gooddingii*), photographed by D. Zobell near the Human History Museum in 2010. An unusual, whitish-flowered phase of hook-spur violet (*Viola adunca*), discovered independently within a week in spring 2011 along the East Rim Trail by Walter Fertig and Peter Lesica & Derrick Zobell (P. Lesica photo). The rare Cedar Canyon pepperwort (*Lepidium montanum* var. *heterophyllum*), photographed by D. Zobell in the Kolob area in 2010.

Figure 3-5. Plant species rediscovered in Zion National Park, 2008–2011. Clockwise from top left: Catnip (*Nepeta cataria*), rediscovered and photographed by Derrick Zobell in 2010. Arizona pincushion (*Coryphantha vivipara* var. *arizonica*) from the vicinity of Crater Hill in Zion National Park, relocated in flower and photographed by Cheryl Decker in 2010. Chicory (*Cichorium intybus*), reported but not confirmed until photographed by Derrick Zobell in 2010. Rock holly-fern (*Polystichum scopulinum*), formerly considered historical and relocated and photographed by Steve McKee in 2007. Fruiting capsules with remnant flowers of Lindley's white bog-orchid (*Habenaria dilatata* var. *leucostachys*), rediscovered by Steve McKee in 2011. Red-osier dogwood (*Cornus sericea*), considered historical until relocated in 2011 by Derrick Zobell.

This table updates Table 3.1 from Fertig and Alexander (2009) and Table 4 of Fertig and others (2010) and reflects new species discovered or re-located in 2009. The number of taxa and families is based on taxonomic concepts of Welsh and others (2008).

### 3.17 Summary of all 16 NCPN units

Since 2008, 432 new vascular plant species have been added to the floras of all 16 park units in the Northern Colorado Plateau Network (Table 3-49). The greatest net increase has come in the flora of Zion National Park, with 83 new plant taxa, followed by Dinosaur National Monument (57), Pipe Spring National Monument (56), and Bryce Canyon National Park and Cedar Breaks National Monument (both with 41). Over this same time period, the status of another 102 species has been changed (Table 3-49). In most cases, species that were formerly classified as

reported or historical in a park have been rediscovered and verified by a specimen, photograph, or confirmed observation (although this list also includes a small number of species shown to be falsely reported on further examination). All told, 534 changes have been made to the annotated checklists of the 16 network parks in the last four field seasons (2008–2011). In addition, recent nomenclatural changes have affected 48 Utah species represented by 159 park records (Fertig et al. 2009). In just four years, nearly 700 changes to park checklists have been necessary to keep up with new research.

**Table 3-49. Summary of changes in the floras of all Northern Colorado Plateau Network parks, 2008–2011.**

Park unit	# taxa circa 2007	# of new taxa 2008–2011	# of changes in park status 2008–2011	# taxa in 2011

## 4 Discussion

As permanently protected lands managed with an emphasis on preserving biological diversity and ecological processes, parks, monuments, recreation areas, and historic sites managed by the National Park Service play a significant role in conserving both common and rare species (Groves et al. 2002; Margules and Sarkar 2007). Knowing the biotic composition of these lands is vital to conservation planning. Although presence in a parkland does not ensure long-term persistence, species found in park units usually have a better chance of survival than on unprotected lands. Gaps in protected-area representation can also be used to drive decisions on protecting new areas (Fertig 2010b).

Well-maintained species checklists are an important conservation tool, complementing their traditional value in assisting researchers, informing managers, and educating the public. Keeping these lists current can be a challenge, as underscored by the rapid rate of change in NCPN floras in just four years. Not surprisingly, the parks that have received the most research attention by botanists in recent years (Pipe Spring NM, Bryce Canyon NP, Zion NP, Dinosaur NM, Cedar Breaks NM) have had large increases in the size of their respective floras. Similar results likely could be achieved in parks that have received less attention, such as Colorado NM, Black Canyon of the Gunnison NP, or Natural Bridges NM.

For species lists to be effective, it is vital that field observations be reliably documented. Ideally, voucher specimens should be secured and deposited in a park or university herbarium and available for verification by experts. High-quality photographs of critical features of a species can be a substitute. Vouchers or photos need to be accompanied by detailed locality information. Observations that are not accompanied by supporting evidence are much less reliable. Numerous new reports for species from recent vegetation mapping studies had to be relegated to “questionable” status in our study because corroborating documentation was not provided. Some of these reports will invariably prove to be correct, but any report of a species that is rare or outside of its suspected range should be treated cautiously so as not to call into question the reliability of the entire park checklist.

As the data provided in this report suggest, it is wrong to assume that inventory work for the 16 park units in the Northern Colorado Plateau Network is completed. New reports will continue to come to light from park employees, researchers, and amateur naturalists. Additional data sources, such as regional university or public herbaria, have not been completely mined for new species records. Revisions of nomenclature and taxonomic relationships will also continue. All of these changes underscore the importance of continued database management within the network. Results from the past four years also demonstrates that inventory is still a key component of the NPS Natural Resource Inventory and Monitoring program.

## **Appendix A. Nomenclatural Changes from the Fourth Edition of *A Utah Flora* (Welsh et al. 2008)**

The annotated checklists (see entries in Chapter 5) for the 11 Utah parks in this report were developed using the nomenclature of the third edition of *A Utah Flora* (Welsh et al. 2003). Shortly before the National Park Service published the checklists, a revised version of the *Utah Flora* was published (Welsh et al. 2008). This new edition introduced a number of changes in nomenclature and species concepts. These changes are summarized in the following table, reprinted from Fertig and others (2009c).

### **Key**

Family and species nomenclature follows Welsh and others (2008).

#### Park codes:

ARCH = Arches NP  
BRCA = Bryce Canyon NP  
CANY = Canyonlands NP  
CARE = Capitol Reef National Park  
CEBR = Cedar Breaks National Monument  
DINO = Dinosaur National Monument  
GOSP = Golden Spike National Historic Site  
HOVE = Hovenweep National Monument  
NABR = Natural Bridges National Monument  
TICA = Timpanogos Cave National Monument  
ZION = Zion National Park

#### Park status:

H = Historical (not relocated since 1970),  
Po = Potential (species has not been found in park yet, but is known from similar habitats in vicinity),  
Pr = Present (confirmed with a voucher),  
R = Reported (cited for park in literature or based on a reliable observation, but without a voucher),  
F = False Report (previous report has been shown to be incorrect or is questionable).

**Table A-1. Nomenclatural changes for the fourth edition of *A Utah Flora*.**

Family	Former species name (Welsh et al. 2003)	Current species name (Welsh et al. 2008)	Park status							Comments	
			ARCH	BRC	CANY	CEBR	DINO	GOSP	HOVE	NABR	
Agavaceae	<i>Yucca harrimaniae</i> var. <i>sterilis</i>	<i>Yucca sterilis</i>				Po					Var. <i>sterilis</i> recognized as a full species.
Caprifoliaceae (Cleomaceae)	<i>Cleomella palmeriana</i> var. <i>goodrichii</i>	<i>Cleomella hillmanii</i> var. <i>goodrichii</i>			R						Var. <i>goodrichii</i> transferred to <i>C. hillmanii</i> .
Caryophyllaceae	<i>Cerastium arvense</i>	<i>Cerastium arvense</i> var. <i>strictum</i>	Po	Po	Pr	Po					Variety name added in Welsh and others (2008).
Caryophyllaceae	<i>Silene scouleri</i> ssp. <i>pringlei</i>	<i>Silene scouleri</i> ssp. <i>hallii</i>			Po						UT material now considered to be ssp. <i>hallii</i> .
Caryophyllaceae	<i>Spergularia marina</i>	<i>Spergularia salina</i>			Po	Po					Po Name change.
Chenopodiaceae	<i>Chenopodium album</i> var. <i>album</i>	<i>Chenopodium album</i>	Pr	R	Pr	Pr	Po				<i>Chenopodium album</i> split into two species.
Chenopodiaceae	<i>Chenopodium album</i> var. <i>berlandieri</i>	<i>Chenopodium berlandieri</i>	Pr	Po	Pr	Po	Pr				<i>Chenopodium album</i> split into two species.
Chenopodiaceae	<i>Salicornia europaea</i> ssp. <i>rubra</i>	<i>Salicornia rubra</i>			Po						Var. <i>rubra</i> elevated to full species.
Chenopodiaceae	<i>Suaeda torreyana</i> var. <i>torreyana</i>	<i>Suaeda nigra</i> var. <i>nigra</i>	Pr	Pr	Pr	Pr	Po				S. <i>torreyana</i> made a synonym of S. <i>nigra</i> .
Compositae (Asteraceae)	<i>Aster kingii</i> (no variety)	<i>Aster kingii</i> var. <i>kingii</i>			F						Variety name added in Welsh and others (2008).
Compositae (Asteraceae)	<i>Baccharis glutinosa</i>	<i>Baccharis salicifolia</i>	Po	F							<i>Baccharis glutinosa</i> made a synonym of <i>B. salicifolia</i> .
Compositae (Asteraceae)	<i>Chrysanthemum</i> <i>nauseosus</i> var. <i>consimilis</i>	<i>Chrysanthemum</i> <i>nauseosus</i> var. <i>oreophilus</i>	Pr	Pr	Pr	Pr	Po				Var. <i>consimilis</i> made a synonym of var. <i>oreophilus</i> .
Compositae (Asteraceae)	<i>Chrysanthemum</i> <i>nauseosus</i> var. <i>gnaphalodes</i>	<i>Chrysanthemum</i> <i>nauseosus</i> var. <i>hololeucus</i>	Pr	Pr	Pr	Pr	Po				Var. <i>gnaphalodes</i> made a synonym of var. <i>hololeucus</i> .
Compositae (Asteraceae)	<i>Erigeron awapensis</i>	<i>Erigeron abajoensis</i>	Pr	Pr							E. <i>awapensis</i> made a synonym of E. <i>abajoensis</i> .
Compositae (Asteraceae)	<i>Erigeron glabellus</i> (without variety)	<i>Erigeron glabellus</i> var. <i>glabellus</i>			F	Pr					Variety name added in Welsh and others (2008).
Compositae (Asteraceae)	<i>Erigeron vagus</i> (without variety)	<i>Erigeron vagus</i> var. <i>madsenii</i>	Pr		Pr						New variety name published by Welsh and others (2008).

Table A-1. Nomenclatural changes for the fourth edition of *A Utah Flora*, cont.

Family	Former species name (Welsh et al. 2003)	Current species name (Welsh et al. 2008)	Park status									Comments	
			ARCh	BRCA	CANY	CEBR	DINO	GOSp	HOVE	NABR	TICA	ZION	
Compositae (Asteraceae)	<i>Gnaphalium wrightii</i>	<i>Gnaphalium canescens</i>		Pr								Pr	<i>Gnaphalium wrightii</i> made a synonym of <i>G. canescens</i> .
Compositae (Asteraceae)	<i>Ambrosia salsola</i>	<i>Hymenoclea salsola</i>										Pr	<i>Ambrosia salsola</i> made a synonym of <i>Hymenoclea s.</i>
Compositae (Asteraceae)	<i>Helenium hoopesii</i>	<i>Hymenoxys hoopesii</i>	Po	Po	Pr								<i>Helenium hoopesii</i> made a synonym of <i>Hymenoxys h.</i>
Compositae (Asteraceae)	<i>Senecio douglasii</i> var. <i>longilobus</i>	<i>Senecio flaccidus</i> var. <i>flaccidus</i>	R	Po	R	Pr	Pr	Po	Pr	Pr			<i>S. douglasii</i> made a synonym of <i>S. flaccidus.</i>
Compositae (Asteraceae)	<i>Senecio douglasii</i> var. <i>monoensis</i>	<i>Senecio flaccidus</i> var. <i>monoensis</i>								Po			<i>S. douglasii</i> made a synonym of <i>S. flaccidus.</i>
Compositae (Asteraceae)	<i>Xylorhiza tortifolia</i> var. <i>imberbis</i>	<i>Xylorhiza imberbis</i>	Pr	Pr	Pr	Po	Po	Po					Var. <i>imberbis</i> elevated to full species.
Cruciferae (Brassicaceae)	<i>Alyssum minus</i> var. <i>micranthum</i>	<i>Alyssum parviflorum</i> var. <i>micranthum</i>		Pr	Pr	Pr	Pr						<i>Alyssum minus</i> made a synonym of <i>A. parviflorum.</i>
Cruciferae (Brassicaceae)	<i>Arabis pulchra</i> var. <i>munciensis</i>	<i>Arabis pulchra</i> var. <i>gracilis</i>								Pr			Var. <i>munciensis</i> made a synonym of var. <i>gracilis.</i>
Cruciferae (Brassicaceae)	<i>Brassica campestris</i>	<i>Brassica rapa</i>								Pr	H		<i>Brassica campestris</i> made a synonym of <i>B. rapa.</i>
Cruciferae (Brassicaceae)	<i>Descurainia incana</i> var. <i>sonnei</i>	<i>Descurainia incana</i> var. <i>incisa</i>	Pr	R	R	Pr	Pr		Pr	Pr			Var. <i>sonnei</i> made a synonym of var. <i>incisa.</i>
Cruciferae (Brassicaceae)	<i>Physaria wardii</i>	<i>Physaria Kingii</i> var. <i>parvifolia</i>		Pr	Pr					Pr			<i>Physaria wardii</i> made a synonym of <i>P. Kingii.</i>
Cruciferae (Brassicaceae)	<i>Rorippa islandica</i> var. <i>glabra</i>	<i>Rorippa palustris</i> var. <i>glabra</i>		R	Pr								<i>Rorippa islandica</i> made a synonym of <i>R. palustris.</i>
Cruciferae (Brassicaceae)	<i>Rorippa islandica</i> var. <i>hispida</i>	<i>Rorippa palustris</i> var. <i>hispida</i>			Pr					R			<i>Rorippa islandica</i> made a synonym of <i>R. palustris.</i>
Cyperaceae	<i>Carex gynocrates</i>	<i>Carex dioica</i> var. <i>gynocrates</i>	Po		Pr								Carex <i>gynocrates</i> made a variety of <i>C. dioica.</i>
Elatinaceae	<i>Elatine triandra</i>	<i>Elatine rubella</i>			Po					Po			<i>Elatine triandra</i> made a synonym of <i>E. rubella.</i>
Guttiferae (Hypericaceae)	<i>Hypericum formosum</i> var. <i>scouleri</i>	<i>Hypericum scouleri</i>	Pr							Po	Pr		Var. <i>scouleri</i> elevated to full species.

Table A-1. Nomenclatural changes for the fourth edition of *A Utah Flora*, cont.

Family	Former species name (Welsh et al. 2003)	Current species name (Welsh et al. 2008)	Park status								Comments
			ARCh	BRCA	CANY	CEBR	DINO	GOSP	NABR	TICA	
Leguminosae (Fabaceae)	<i>Dalea oligophylla</i>	<i>Dalea occidentalis</i>	Pr	Pr				Po	Pr		<i>Dalea oligophylla</i> made a synonym of <i>D. occidentalis</i> .
Leguminosae (Fabaceae)	<i>Lupinus latifolius</i> var. <i>columbianus</i>	<i>Lupinus latifolius</i> var. <i>leucanthus</i>									Var. <i>columbianus</i> made a synonym of var. <i>leucanthus</i> .
Nyctaginaceae	<i>Abromia fragrans</i> (without variety)	<i>Abromia fragrans</i> var. <i>fragrans</i>	Pr	Pr	Pr	Pr	Pr	Pr	Pr		Two varieties recognized in Welsh and others (2008).
Onagraceae	<i>Camissonia walkeri</i> (without variety)	<i>Camissonia walkeri</i> var. <i>tortilis</i>									Zion material belongs to new variety <i>tortilis</i> .
Onagraceae	<i>Camissonia walkeri</i> (without variety)	<i>Camissonia walkeri</i> var. <i>walkeri</i>	Pr	Pr	Pr	Pr	Pr	Po	Po		Two varieties recognized in Welsh and others (2008).
Onagraceae	<i>Oenothera californica</i> (without variety)	<i>Oenothera californica</i> var. <i>avita</i>									New variety named by Welsh and others (2008).
Polypodiaceae (Adiantaceae or Sispteridaceae)	<i>Pellaea glabella</i> var. <i>occidentalis</i>	<i>Pellaea glabella</i> ssp. <i>simplex</i>	Pr	Pr		Pr		Pr	Pr		Var. <i>occidentalis</i> made a synonym of ssp. <i>simplex</i> .
Potamogetonaceae	<i>Potamogeton nodosus</i>	<i>Potamogeton fluitans</i>				Pr					<i>Potamogeton nodosus</i> made a synonym of <i>P. fluitans</i> .
Primulaceae	<i>Samolus floribundus</i>	<i>Samolus valerandi</i>									<i>Samolus floribundus</i> made a synonym of <i>S. valerandi</i> .
Ranunculaceae	<i>Delphinium andersonii</i> var. <i>andersonii</i>	<i>Delphinium scaposum</i> var. <i>andersonii</i>				Po					<i>Delphinium scaposum</i> is the earliest name for the species.
Ranunculaceae	<i>Delphinium andersonii</i> var. <i>scaposum</i>	<i>Delphinium scaposum</i> var. <i>scaposum</i>	Pr	Pr	Pr	Pr		R	Pr		<i>Delphinium scaposum</i> is the earliest name for the species.
Umbelliferae (Apiaceae)	<i>Aletus macdougalii</i> ssp. <i>breviradiatus</i>	<i>Cymopterus macdougalii</i>			Po						<i>Aletus</i> made a synonym of <i>Cymopterus</i> .
Umbelliferae (Apiaceae)	<i>Oreoxis alpina</i>	<i>Cymopterus alpinus</i>			Po						<i>Oreoxis</i> made a synonym of <i>Cymopterus</i> .
Umbelliferae (Apiaceae)	<i>Oreoxis trotteri</i>	<i>Cymopterus trotteri</i>	F		Po						<i>Oreoxis</i> made a synonym of <i>Cymopterus</i> .
Umbelliferae (Apiaceae)	<i>Pastinaca sativa</i> (without ssp.)	<i>Pastinaca sativa</i> ssp. <i>sylvestris</i>				Po					Subspecies recognized in Welsh and others (2008).
Urticaceae	<i>Parietaria pensylvanica</i> (without var.)	<i>Parietaria pensylvanica</i> var. <i>pensylvanica</i>			Po						Varieties recognized in Welsh and others (2008).

The Department of the Interior protects and manages the nation's natural resources and cultural heritage; provides scientific and other information about those resources; and honors its special responsibilities to American Indians, Alaska Natives, and affiliated Island Communities.
