DAFFODILS & NARCISSI

(ONLY LARGE DOUBLE NOSED BULBS SUPPLIED)

Cultivation & Planting Guide

Naturalizing Daffodils and Narcissi in Grass, etc. Most Daffodils and Narcissi are suitable for naturalizing but in very heavy soils, preference should be given to stronger growing kinds, e.g. Trumpet varieties and many Large-Cupped. They are all admirably adaptable for grassy slopes and banks, where they should be freely planted. A splendid effect is obtained when Trumpet and other varieties are grouped separately, scattered on the ground and planted where they fall.

Soil and its Treatment. Daffodils and Narcissi will thrive in any well-cultivated and well-drained garden soil. In preparing the ground for planting, dig deeply and if well-rotted stable or cow manure is available this may be advantageously worked in 10 to 16 inches deep so as not to come into immediate contact with the bulbs. Never use fresh manure of any kind at planting time. On poor and dry sandy soils we recommend a dressing of bone meal at a rate of about 1 oz. per square yard to be sprinkled over the surface of the ground after planting. The bulbs should be covered with soil to a depth of one and a half to twice its own depth, measuring the bulb from base to shoulder.

HEIGHT — The heights given in inches are as recorded at our nurseries.

DEPTH TO PLANT — Failures with bulbs are most frequently due to their having been planted too deeply or too shallow. A good general rule to follow is to cover the bulb with soil one and a half to twice its own depth, measuring the bulb from the base to shoulder. Thus a daffodil bulb measuring two inches from base to shoulder should be covered with 3-4 inches of soil.
