# Wildflower Planting Information

## WHEN TO PLANT WILDFLOWERS

If you are hand-watering or using irrigation, you may plant wildflowers just about anytime of the year. The natural time to plant, however is early fall, before the first rain or during the early part of the rain season. The blooming season will begin the following spring, though some perennials may need two years to take hold.

## PLANTING RATES

The amount of seed needed to sow any given area may vary a bit with the type of soil, climate, terrain, etc. Our recommendations are for fairly flat areas, clear of trees and shrubbery.

Amount of Seed	Area Covered
1 oz	150-200 square feet
1 lb	1,000-3,000 square feet
15 lbs	One acre, flat terrain
20 lbs	One acre, sloping terrain

## HOW TO SOW WILDFLOWERS

It is common practice, where accessible, to use a “belly grinder” or drop spreader to spread seeds over an area. Quite often good results are obtainable by merely scattering the seeds by hand. We suggest that an inert spreader such as sand or some other inert “carrier” be used, to help spread the seed evenly. Use a product similar in weight and size to the seed mix. Use a 4:1 ratio, by volume of “carrier” to seed. If possible, rake in lightly. Most seeds do not need to be laid very deep and, in fact, might perform more poorly if planted too deep.

## SITE PREPARATION

Weed control is very important. Remove as much undesired vegetation from the area as possible. Wildflowers can be quite hardy, but natural grasses and weeds are some of nature’s most vigorous plants. Grasses may become thick and matted, and not a good condition under which most wildflowers can survive.

## IF IRRIGATION IS AVAILABLE

All surface areas must be kept continuously moist. This is accomplished with frequent, light watering. Please do not allow the newly seeded areas to dry out. Once the seeds have germinated and the planted area looks established, the plants should be gradually weaned from water. Water may be applied with less frequency, but for longer periods of time; deep watering will encourage deep root growth.

## IF NO IRRIGATION IS AVAILABLE

During the rainy months of Fall, Winter, Spring, wildflower seeds are soaked for a long period of time. During this time, their natural dormancy is broken. The seed germinate and immediately begin to send down long tap roots. When the warm days of Spring come, they literally burst into bloom!!!!

**SERVING YOU SINCE 1947**

1250 Sebastopol Road  
Santa Rosa California 95407

.....

Our Standard terms are Net 30 with a 1 ½ per month finance charge for overdue accounts. As in any agricultural commodity market, prices and availability are subject to change without notice. Ordinarily, our quotes are good for two weeks. If more time is needed we are often able to extend the option at our customer's request. We will refund your purchase price if the seed we ship to your does not conform to the analysis tag.

**WARRANTY**

LeBallister's warrants to the extent of the purchase price that seeds we sell are as described on the container within recognized tolerances. Our liability or otherwise is limited in amount to the purchase price of the seed. We make no further warranty, expressed or implied. Seed not accepted under these terms and conditions must be returned within 14 days in original, unopened containers and the purchase price will be refunded.
