**Management of the plant collection
at the Eastwoodhill Arboretum**

Volume II: Appendices

A thesis presented in partial
fulfilment of the requirements
for the degree of

DOCTOR OF PHILOSOPHY

in Horticultural Science at
Massey University.

Marion Brenda MacKay

1996

Abstract

Eastwoodhill Arboretum at Ngatapa, near Gisborne, New Zealand, was developed by the late William Douglas Cook (1884-1967). Between 1920 and 1960, Cook planted an extensive range of exotic woody trees, shrubs and climbers throughout 65 hectares of the 130 hectare property. Considered by many to be an important collection in New Zealand, the Arboretum deteriorated during Cook's latter years due to diminishing time and resources for maintenance. An Act of Parliament in 1975 established the Eastwoodhill Trust Board and empowered them to 'maintain and develop the property as an arboretum'. Under the Board's direction, a clearing strategy was initiated to solve the problems of overcrowding and poor plant condition in the Arboretum and to establish a catalogue of the collection.

To meet their obligations under the Act, the Trust Board had to focus their management on the plant collection. The biological value of the Arboretum had to be sustained, particularly with respect to issues of conservation and biodiversity. The visual value of the Arboretum, an important factor for attracting public support, had deteriorated and required intervention. Moreover, as the landscape of the Arboretum was not a natural system and lacked self-regulating processes for renewal of important plants or plant groupings, systematic management was needed to sustain the collection within this human-made landscape. The Trust Board's efforts to address these issues were hampered by a lack of resources and appropriate data.

This research reports the results of an extensive landscape management study of the collection and develops and characterises the data and management processes needed for long term management of the biological value of the Arboretum. Although management frameworks and processes for landscape management have been reported in the literature, most operate at scales inappropriate for single sites and none focus upon the human-made landscape of an arboretum. Thus, while common characteristics of these processes (e.g. inventory, evaluation, development of goals and strategies) provided a basic framework, their application to an arboretum required development.

A complete and current inventory of the plant collection was made. The Arboretum was mapped at 1:200 using a grid square method, and a catalogue formed listing every plant in the collection. A second catalogue recorded the extensive range of accessions that had previously been in the collection but which no longer existed. In addition, about 1200 herbarium samples were made, two potential database formats developed for the data, and a record of management history formulated.

Although the inventory showed that the collection was extensive, its importance could only be established through an evaluation. As an extensive literature search failed to locate a suitable

process for evaluating a plant collection on a single site, a novel process was proposed that evaluated the site using two key concepts, significance and condition, and linked this evaluation to the goals of the Arboretum. Significance, a measure of the importance of a site according to selected landscape values, was determined using various indicators of diversity and rarity. Analysis revealed that Eastwoodhill was the most significant collection of its type in New Zealand, with 1666 species and 962 cultivars of trees, shrubs and climbers, of which 73% were of northern hemisphere origin and 41% of Asian origin. Eighty percent of species and cultivars in the collection were not readily available from commercial sources in New Zealand, and 102 species were on world conservation lists. These data were used to identify the most significant genera in the collection. The second concept, condition, measures health (in the broadest sense) of the site using such indicators as age, density, and maturity. Measurements of age and density showed that condition of the collection was below optimum. Moreover, plant death, particularly of short lived species, had changed the composition of the collection to the extent that about 53% of the plants collected by Cook no longer existed.

The evaluation process also revealed that while the collection had the potential to meet existing goals, condition was not ideal and unless it was improved significance could be lost. This interaction between significance and condition lead to the proposal of a new concept for ‘landscape category’ as a framework for describing the relationship between the two factors. Four categories, each requiring different management actions, were derived and discussed. The mission of the arboretum indicates which category is required, while the evaluation data show which category actually applies. To achieve the role of an arboretum in the long term Eastwoodhill needs to be a category one landscape (i.e. significant and in good condition), but is currently in category two (i.e. significant but with condition below par). This discrepancy between actual category and required category indicated the subsequent management action necessary to bring the Arboretum to category one status.

The second new concept arising from this research was developed as part of the processing stage of the evaluation. As Eastwoodhill is an arboretum, and biological value underpins its primary purpose, both biological significance and condition must be excellent. But vegetation also has aesthetic values, particularly visual qualities, and these play an essential role in many of the human values associated with arboreta. Landscape management paradigms were established to provide a framework for managing the balance between biological and visual value of a site. The paradigms describe a hierarchy for managing the interplay between biological and visual values, and can be configured for either value in the primary position. This concept provides a framework for integrating values and prioritising subsequent management actions. The evaluation data,

landscape category, and landscape management paradigms were used to propose management actions and priorities for those actions.

Three workshops were conducted during the course of this research to address a series of collection management issues. Conducted using a systematic management approach, the workshops involved a panel of experts using the data from inventory and evaluation to prepare three reports outlining plans and decisions for short and long term management of the plant collection. An important long term outcome was an assessment of the collection using botanical and aesthetic rating scales to determine the intrinsic importance of the genera in the collection. These data were used to identify the 'key' genera that would form the focus of collection development and to determine roles for the Arboretum. Detailed operational plans for three parks and two key genera within the Arboretum were also prepared during the workshops. Park plans covered objectives for the park, composition of the park, botanical and aesthetic importance of plants in the park, and future development strategies. Genus plans covered composition of that genus in the collection, status of key plants in the field, and future development policies. A key feature of park and genus plans was a system of rating scales used to determine plant status and prioritise management decisions. Development of park and genus plans led to a proposal for a method for vegetation management in human-made landscapes.

Overall synthesis of the management process led to a proposal for a model for management of a plant collection that could be applied to Eastwoodhill and other plant collections. Understanding of the underpinning principles allows the model to be readily adapted for application to other landscapes.

keywords: arboretum management, botanic garden management, landscape evaluation, landscape inventory, landscape management, plant collection, vegetation management.

Acknowledgements

I am very appreciative of the efforts of my supervisors in helping me complete this work. Dr David Chalmers was an enthusiastic participant in the workshops, and provided valuable editorial comment on early drafts of this thesis. In more recent times Dr Tony Jackman and Professor Errol Hewett made themselves available for consultation and I am grateful for their patient, thorough and timely edits of this work.

I wish to thank the Department of Plant Science and Massey University for the opportunity to undertake postgraduate study. I am particularly grateful to Professor Robert Anderson, Dean of Agricultural and Horticultural Sciences, for encouraging me to undertake the early visits to Eastwoodhill that led to this work being started.

The Eastwoodhill Trust Board and associates played a key role in this work. I thank them for making the Arboretum and its facilities available for this study, and for their willingness to support and participate in the workshops. The curator, Mr Clapperton, provided hospitality on many occasions and assisted with information and frequent discussions about the Arboretum.

This work would not have been possible without the funding support provided by the Massey University Agricultural Research Foundation, the C. Alma Baker Trust, the New Zealand Lottery Board, the Massey University Research Fund and the Faculty of Agricultural and Horticultural Sciences. I am grateful to these bodies for their support.

Studying the plant collection at Eastwoodhill required considerable field work and regular visits to Gisborne. I am very grateful to Stuart and Jackie Davis, for extending their hospitality to me on numerous occasions and allowing me to use their home as a base for my field work.

My family and friends have continued to give moral support to this endeavour. My parents, and my friends Pam Howell and Elizabeth Patching, deserve special mention for always being available with time to listen and give encouragement.

Finally, and most of all, my husband Bruce deserves the highest praise for his unlimited dedication and patience over many years. He gave energy, drive, and generosity of spirit that helped me complete this work and I am deeply grateful to him for his continued encouragement and contribution throughout this study.

4.3.1.1	Participants	214
4.3.1.2	Roles	216
4.3.2	Operation of the workshops	217
4.3.2.1	Planning the workshops	217
4.3.2.2	Programme	218
4.3.2.3	Decision making and data	219
4.3.2.4	Implementation of workshop outcomes	220
4.3.3	The workshops as a management strategy	221
4.3.3.1	Strengths: a possible framework for collection management	222
4.3.3.2	Weaknesses	225
4.3.3.3	Modifications	226
4.3.3.4	Workshops needed because of changes in the enterprise	228
4.4	Groups or individual decision makers	229
4.4	Conclusion	231

CHAPTER 5: USING THE WORKSHOP FOR COLLECTION MANAGEMENT PART ONE: LONG RANGE GOALS

5.1	Introduction	235
5.2	Method	236
5.2.1	Assessment of the collection	236
5.2.2	Role of the Arboretum and development of the collection	238
5.2.3	Development of the remaining 65 hectares of the property	238
5.3	Results and discussion	240
5.3.1	Establishing the present status of the collection	240
5.3.1.1	Assessment of the collection	240
5.3.1.2	Key genera	243
5.3.2	The role of the Arboretum	247
5.3.3	Goals for development of the collection	249
5.3.3.1	Development of the remaining 65 hectares	253
5.3.3.2	Key genera in the future	254
5.3.4	Critique of the method	257
5.3.5	Development of a strategic position	259
5.4	Conclusion	260

CHAPTER 6: USING THE WORKSHOP FOR COLLECTION MANAGEMENT PART TWO: PARK AND GENUS PLANS

6.1	Introduction and review	263
6.1.1	The need for deliberate management action to sustain vegetation in human-made landscapes	263
6.1.2	Knowledge needed in vegetation management	266
6.1.2.1	Understanding the life phases of a plant	266

6.1.2.2 Measuring plant status - rating scales	268
6.1.2.3 Understanding plant populations in human-made landscapes	277
6.1.2.4 Managing plant populations in human-made landscapes	277
6.1.3 A systematic approach to vegetation management	280
6.1.4 Eastwoodhill Arboretum	281
6.2 Method	282
6.2.1 Developing vegetation management plans	282
6.2.2 Rating scales to measure tree attributes	282
6.2.3 Application of the rating scales	285
6.2.4 Genus and park plans	286
6.2.4.1 Tree management exercises at the first workshop: a forerunner to the park and genus plans	286
6.2.4.2 Genus plans	287
6.2.4.3 Park plans	290
6.3 Results	295
6.3.1 Park plans	295
6.3.2 Genus plans	296
6.4 Discussion	297
6.4.1 Methodology for park and genus plans	297
6.4.2 A vegetation management framework: understanding and concepts	299
6.4.2.1 'When': vegetation management and plant performance	300
6.4.2.2 'Where': vegetation management and physical layout	303
6.4.3 A framework for vegetation management: process	305
6.5 Conclusion	309
CHAPTER 7: GENERAL DISCUSSION	
7.1 Introduction	313
7.2 Managing a plant collection: a model	313
7.2.1 Understanding management concepts	316
7.2.2 The management process: strategic position absent or under review	320
7.2.3 The management process: strategic position present	326
7.2.4 Application to other landscapes	327
7.2.5 Further developments	328
7.3 Eastwoodhill Arboretum and the future of its plant collection	329
7.3.1 Preview	329
7.3.2 Outcomes of this research	329
7.3.3 Future approaches: utilising this research for collection management	332
7.3.3.1 Opportunity: reviewing the purpose, mission and goals of landscape management	333
7.3.3.2 Opportunity: reviewing systematic management approaches	333
7.3.3.3 Challenge: resolving issues relating to mission and strategic position	334
7.3.3.4 Opportunity: using a revised workshop method for collection management	336

7.3.3.5 Challenge: making best use of the workshop and decision making methods	337
7.3.3.6 Challenge: resources for collection management	338
7.3.4 A possible plan of action for the Trust Board	339
7.4 Conclusion	340

Introduction to Volume II

This volume contains the appendices that relate to the thesis 'Management of the plant collection at the Eastwoodhill Arboretum' which comprises Volume I. These appendices contain various archival data and documents that relate to the investigations that were carried out to complete the thesis.

Appendices 1, 2 and 3 are inventory documents for the collection and are discussed in Chapter 2 in Volume I.

Appendix 4 is part of the evaluation of the collection and relates to Chapter 3 in Volume I.

Appendices 5, 6 and 7 are the three workshop reports that were completed as part of this study and relate primarily to Chapter 4 in Volume I, but also to Chapters 5 and 6. These reports were written several years before this thesis was completed, and there are sometimes minor differences in detail between them and the main body of the thesis, e.g. numbers of species and cultivars in the collection may have changed slightly due to new data subsequent to the workshops. It should also be noted that, although the author was acting as workshop manager at the time, the workshop reports represent the consensus view of the workshop group, and not the view of the author.

Appendix 8 is the collection assessment data and relates to Chapter 5 in Volume I.

Inventory Part One: The ‘current’ collection

CATALOGUE OF TREES, SHRUBS AND CLIMBERS

**Marion MacKay
Massey University, Palmerston North**

**First published 1989
Revised but not re-published 1993**

Eastwoodhill Publication No. 1

This catalogue is one of three parts which comprise the inventory for the plant collection at the Eastwoodhill Arboretum. This catalogue describes the current collection. Part two is the accompanying set of maps which show the location of each tree. Part three describes the additional plant material which was in the collection but is no longer present. These documents have been prepared following the completion of a comprehensive inventory of all plants at the Arboretum.

Acknowledgements

The author acknowledges the information provided by Mr G.W. Clapperton, Curator, Eastwoodhill, and Mr R.J. Berry, Hackfalls Arboretum, Tiniroto.

The preparation of this catalogue and the accompanying plan set was completed with the support of the Massey University Agricultural Research Foundation, the C.Alma.Baker Trust, and the New Zealand Lottery Board.

INTRODUCTION

This catalogue and the associated set of plans are the result of a three year study on the plant material at the Eastwoodhill Arboretum. This project is the founding study of a programme on botanical resources at the Arboretum, and in New Zealand, which has been initiated at the Department of Horticultural Science at Massey University.

Eastwoodhill is 35km from Gisborne in a relatively isolated rural area of undulating to steep hill country. The Arboretum encompasses 65 hectares, with another 65 hectares of land unplanted. The elevation at the Eastwoodhill homestead is 150m a.s.l. with higher ridges to the north and west. Latitude is 38 degrees 33 minutes south, and longitude 177 degrees 40 minutes east. Rainfall averages 1000mm annually. Frossts may be minus 4-7 degrees Celsius.¹

The Arboretum contains mostly northern hemisphere trees shrubs and climbers, approximately 2600 species and cultivars of plants, with about 8000 trees in all. Northern hemisphere plants make up 75% of the collection, 15% is southern hemisphere flora, 10% horticultural origin. A significant portion of the collection (42%) is of Asian origin.

The Arboretum was the life's work of Mr W.D.Cook (1884-1967), horticulturist, of Gisborne. Douglas Cook came to the property in 1910; he described it as virgin land of mixed grasses and covered in manuka scrub. In 1910 he planted radiata pine and eucalyptus for firewood and an orchard for home use. Many thousands of timber trees were planted on dry ridges and poor places. The framework for park planting included *Platanus orientalis*, *Acer pseudoplatanus*, *Acer platanoides*. He started with what he described as 'bits and pieces', but began planting in quantity in 1917 after returning unfit from World War 1. He was disturbed by what he had seen in Europe and was afraid that the north would destroy itself along with its trees. In 1922-1924 Douglas Cook travelled to England and visited gardens. "I loved the country scene in England and its beautiful parks and wondered how far I could get in the creation of a park in one lifetime. I determined to make a start." He began acquiring plants in earnest in about 1927 and continued to do so until the late 1950s. Glen Douglas was the last planting, in about 1960.

Although Mr Cook obtained some plants from New Zealand sources, the majority of the material came from overseas. The main supplier was Hillier and Sons of England. Over time Mr Cook imported about 5000 different species and cultivars of plants. Although only about half remain today, he had amassed a collection of trees unique in New Zealand.² In 1949 he wrote in the Royal Horticultural Society journal, "We hope in the very near future to be growing at Eastwoodhill practically every tree and shrub available in Britain." For his lifelong contribution to horticulture Douglas Cook was awarded the prestigious Veitch Memorial Medal.

In his latter years Mr Cook was anxious that his collection be preserved. Two years before Mr Cook's death Eastwoodhill was purchased by local businessman Mr H.B.Williams of Gisborne. In 1975, after the passing of the Eastwoodhill Trust Act, Mr Williams gifted the Arboretum to the newly formed Eastwoodhill Trust Board. In the initial years after Mr Cook's death investigation of the collection was done by Mr R.J. Berry of Gisborne. He was a member of the Trust Board and compiled information on the collection by way of a catalogue in 1976, revised in 1980 and 1982.

I became associated with the Arboretum from early 1986. At that time it was apparent that, for planning purposes, a detailed inventory of the collection was needed. The property had not been comprehensively mapped and the full extent of the collection was unknown. Each park within the arboretum was subjected to a detailed study involving field and laboratory work. Initially the only information available was the early work by Mr Berry, and some survey work undertaken about 20 years ago which covered the lower parks of the arboretum; latterly Mr Clapperton constructed a map of the property at 1:2000 from aerial photographs. Using this information as a base I formed plans for each park at a scale of 1:200. These show every tree plus physical features. The name for the tree is shown, its reference number, and the name of the person who has confirmed the identity of that particular tree. Written descriptions and photographs were taken when appropriate. An herbarium of approximately 1200 specimens and considerable written archival material complete the data.

Although the identity of every plant may not be known, the documents provided by this study form a framework for the addition of further information, and the basis for further study of the collection. I wish to thank the Eastwoodhill Trust Board for their goodwill and cooperation for the duration of this project.

Marion MacKay

January 1993

Footnotes

1. Physical information provided by Mr R.J.Berry
2. A review of the material imported for the collection can be found in part three of the inventory.

The catalogue method

This catalogue is an alphabetical listing of all the trees, shrubs and climbers at the Eastwoodhill Arboretum. Each entry follows the pattern:

Scientific name. Naming authority. COMMON NAME. Country of origin. Source. Location and confirmation of identity.

Not all pieces of information are available for each entry. Location is indicated by number and letter codes, e.g. M3, L4, N9, which refer to a particular grid square on the map. Confirmation of identity is indicated by the + sign, and the initials of the person by whom the identity was confirmed. For example, *Lagunaria patersonii* M3+MM, is located in square M3 and the identity has been confirmed by MM, which in this case is the author.

Cedar Lodge	Cedar Lodge Nursery, New Plymouth, New Zealand.
Collier	Gordon Collier, Taihape, New Zealand.
Costello	Terry Costello, Tairawhiti Polytech, Gisborne, New Zealand.
Denes	Denes Gardenway, Havelock Nth, New Zealand.
D&D	Duncan and Davies Nursery, New Plymouth, New Zealand.
DSIR	Department of Industrial and Scientific Research, New Zealand; Ak, Auckland; Ax Alexandra.
Etherington	G. Etherington, Nelson, New Zealand.
Food Resources Ltd	Auckland, New Zealand.
Fraser	Frasers Garden Centre, Kihikihi, New Zealand.
Freeman	Ray Freeman, Albany, New Zealand.
FRI	Forestry Research Institute, Rotorua, New Zealand.
Gallen	Judge Gallen, Havelock Nth, New Zealand.
Gordon	Ron Gordon, Taihape, New Zealand.
Goodwin	Jack Goodwin, New Plymouth, New Zealand.
Goudie	Goudie's Nursery, New Zealand.
Hamilton	Don Hamilton, Katikati, New Zealand.
Harrison	Harrison's Tree Nursery, Palmerston North, New Zealand.
Hatch	Terry Hatch, Joy Plants, Pukekohe, New Zealand.
Henderson	Jarrah Park, Tauranga, New Zealand.
Heritage	Heritage Horticulture, New Zealand.
H&S	Hillier and Sons, England.
Hortex	John Stuart-Menzies, Tauranga, New Zealand.
Horsham	John Horsham, Scotland.
Horton	Horton's Nursery, New Zealand.
IDS	Plants purchased with money donated by the International Dendrology Society.
Jellyman	Allan Jellyman, New Plymouth, New Zealand.
Just	B H Just, Palmerston North, New Zealand.
Karaca	Hayrettin Karaca, Karaca Arboretum, Turkey.
KH	Knap Hill Nursery, England.
MAF	Ministry of Agriculture and Fisheries, New Zealand.
Martin E.	E. Martin, Hamilton, New Zealand.
Massey	The New Zealand Rhododendron Association Nursery, previously attached to Massey University, New Zealand.

McKay	Bill McKay, then of Gisborne, New Zealand.
McKean	Ian McKean, Rangiwahia, New Zealand.
Millichamp	Millichamp's Nursery, Ashburton, New Zealand.
Mike Steven	Hamilton, New Zealand.
Mortimor	Bunny Mortimor, Hamilton, New Zealand.
Murphy	Peter Murphy, Gisborne, New Zealand.
MWD	Ministry of Works and Development, Plant Materials Centre, New Zealand.
Nairn	Nairn Brothers Nursery, Christchurch, New Zealand.
Nichols	John Nichols, Tauranga, New Zealand.
NZFS	New Zealand Forest Service, New Zealand.
NZRA	New Zealand Rhododendron Association.
Ormond	Peter Ormond, Havelock Nth, New Zealand.
Overbye	John Overbye, Ormond, Gisborne, New Zealand.
Platt	Graeme Platt, Platts Nursery, Auckland.
PS	Private source.
Puha	Timberlands Puha Nursery, Gisborne, New Zealand.
Pukeiti	Pukeiti Rhododendron Trust, New Plymouth, New Zealand.
Purdie	John Purdie, Havelock North, New Zealand.
Read	Nigel Read, Taradale, Napier, New Zealand.
Rosetead	John Stephenson, Hastings, New Zealand.
Scrivener	Mollie Scrivener, Geraldine, New Zealand.
Slocock	Slocock Nursery, England.
Stevens	Stevens Nursery, New Zealand.
Tantrum	Don Tantrum, Taihape, New Zealand.
Thermal	Thermal Nursery, Rotorua, New Zealand.
Toptrees	Toptrees Nursery, Hastings, New Zealand.
Veitch	Veitch's Nursery, England.
Webb	Webb's Nursery, New Zealand.
Welch	Stuart Welch, Marton, New Zealand.
White	P & J White, Hawkes Bay, New Zealand.
White	Stan White, Te Mahanga, New Zealand.
Wilson	Wilson's Nursery, Christchurch, New Zealand.

Families and Genera in the current collection at Eastwoodhill

Total: 118 families, 410 genera.

GYMNOSPERMAE: 8 families, 36 genera**Ginkgoales**

Ginkgoaceae: Ginkgo

Coniferales

Araucariaceae:	Agathis, Araucaria
Cephalotaxaceae:	Cephalotaxus
Cupressaceae:	Chamaecyparis, X Cupressocyparis, Cupressus, Juniperus, Libocedrus, Thuja, Thujopsis, Widdringtonia
Pinaceae:	Abies, Cedrus, Keteleeria, Larix, Picea, Pinus, Pseudolarix, Pseudotsuga, Tsuga
Podocarpaceae:	Dacrycarpus, Dacrydium, Phyllocladus, Podocarpus, Prumnopitys.
Taxaceae:	Taxus, Torreya
Taxodiaceae:	Cryptomeria, Cunninghamia, Glyptostrobus, Metasequoia, Sciadopitys, Sequoia, Sequoiadendron, Taiwania, Taxodium

ANGIOSPERMAE: 110 families, 374 genera**Monocotyledonae**

Agavaceae:	Cordyline, Furcraea, Phormium
Amaryllidaceae:	Beschorneria, Bomarea, Doryanthes
Aracaceae(Palmae):	Phoenix, Trachycarpus
Liliaceae:	Smilax
Poaceae(Graminae):	Arundo, Phyllostachys

Dicotyledonae

Acanthaceae:	Beleoporone, Strobilanthes, Thunbergia
Aceraceae:	Acer
Anacardiaceae:	Cotinus, Pistachia, Rhus, Schinus, Spondias
Anonaceae:	Asimina
Apiaceae:	Heteromorpha
Apocynaceae:	Nerium, Strophanthes, Trachelospermum
Aquifoliaceae:	Ilex
Araliaceae:	Aralia, Fatsia, Pseudopanax
Aristolochiaceae:	Aristolochia
Asclepiadaceae:	Wattakaka
Asteraceae:	Brachyglottis, Dahlia, Eupatorium, Helichrysum, Olearia, Senecio
Berberidaceae:	Berberis, Mahonia, Nandina

Betulaceae:	Alnus, Betula, Carpinus, Corylus, Ostrya
Bignoniaceae:	Campsis, Catalpa, Doxantha, Eccremocarpus, Jacaranda, Pandorea, Phaedranthus, Podrannea, Tecomanthe
Buxaceae:	Buxus, Sarcococca
Caesalpiniaceae:	Cassia, Ceratonia, Cercis, Gleditsia, Gymnocladus, Peltophorum
Calycanthaceae:	Calycanthus, Chimonanthus
Caprifoliaceae:	Abelia, Diervilla, Dipelta, Kolkwitzia, Lonicera, Sambucus, Viburnum, Weigelea.
Casuarinaceae:	Casuarina
Celastraceae:	Catha, Celastrus, Euonymus, Maytenus, Tripterygium.
Cercidiphyllaceae:	Cercidiphyllum
Cistaceae:	Cistus
Clethraceae:	Clethra
Coriariaceae:	Coriaria
Cornaceae:	Aucuba, Cornus, Griselinia
Corynocarpaceae:	Corynocarpus
Cunoniaceae:	Callicoma, Ceratopetalum, Cunonia
Cyrillaceae;	Cyrilla
Davidiaceae:	Davidia
Ebenaceae:	Diospyros
Ehretiaceae:	Ehretia
Elaeagnaceae:	Elaeagnus
Elaeocarpaceae:	Aristotelia, Elaeocarpus
Epacridaceae:	Cyathodes
Ericaceae:	Arbutus, Enkianthus, Erica, Gaultheria, Kalmia, Ledum, Leucothoe, Lyonia, Oxydendrum, Pieris, Rhododendron, Vaccinium
Escalloniaceae:	Carpodetus, Escallonia
Eucommiaceae:	Eucommia
Eucryphiaceae:	Eucryphia
Euphorbiaceae:	Glochidion, Mallotus, Sapium
Fabaceae:	see Caesalpiniaceae, Mimosaceae, and Papilionaceae.
Fagaceae:	Castanea, Castanopsis, Fagus, Lithocarpus, Nothofagus, Quercus
Flacourtiaceae:	Aberia, Azara, Berberidopsis, Idesia, Poliothyrsus
Garryaceae:	Garrya
Hamamelidaceae:	Corylopsis, Disanthus, Distylum, Fothergilla, Hamamelis, Liquidamber, Loropetalum, Parrotia, Parrotiopsis, Stachyurus, Sycopsis
Hippocastanaceae:	Aesculus
Hypericaceae:	Hypericum
Icacinaceae:	Pennantia
Illiciaceae:	Illicium
Juglandaceae:	Carya, Juglans, Platycarya, Pterocarya
Lamiaceae:	Colquhounia, Lavandula, Prostanthera, Rosmarinus, Salvia, Teucrium
Lardizabalaceae:	Akebia, Decaisnea, Holboellia, Lardizabala, Stauntonia
Lauraceae:	Cinnamomum, Laurus, Neolitsia, Persea, Sassafras, Umbellularia
Leguminosae:	see Fabaceae
Loganiaceae:	Buddleja, Desfontainea, Gelsemium

Lythraceae:	Lagerstroemia
Magnoliaceae:	Liriiodendron, Magnolia, Manglietia, Michelia, Schisandra, Talauma
Malvaceae:	Abutilon, Hibiscus, Hoheria, Lagunaria
Melastomataceae:	Tibouchina
Meliaceae:	Melia, Toona
Melianthaceae:	Greyia
Mimosaceae:	Acacia, Albizia, Calliandra, Leucaena, Pithecellobium
Monimiaceae:	Hedycarya
Moraceae:	Broussonetia, Cudrania, Ficus, Morus, Paratrophis
Myoporaceae:	Myoporum
Myricaceae:	Myrica
Myrsinaceae:	Myrsine
Myrtaceae:	Angophora, Baeckia, Callistemon, Eucalyptus, Feijoa, Leptospermum, Melaleuca, Metrosideros, Myrtus, Syzygium, Tristaniopsis, Ugni.
Nyssaceae:	Nyssa
Ochnaceae:	Ochna
Oleaceae:	Abeliophyllum, Chionanthus, Fontanesia, Forsythia, Fraxinus, Jasminum, Ligustrum, Nestegis, Olea, Osmanthus, X Osmarea, Parasyringa, Syringa
Onagraceae:	Fuchsia
Papilionaceae:	Amorpha, Castanospermum, Cladrastis, Cianthus, Cytisus, Erythrina, Genista, Goodia, Hardenbergia, Hedysarum, Indigofera, Kennedia, Laburnum, Lespedeza, Petteria, Piptanthus, Robinia, Sesbania, Sophora, Spartium, Virgilia, Wisteria.
Passifloraceae:	Passiflora
Pittosporaceae:	Hymenosporum, Pittosporum, Sollya
Platanaceae:	Platanus
Plumbaginaceae:	Ceratostigma
Proteaceae:	Banksia, Embothrium, Grevillea, Knightia, Lomatia, Macadamia, Protea
Punicaceae:	Punica
Ranunculaceae:	Clematis, Paeonia
Rhamnaceae:	Alphitonia, Ceanothus, Hovenia, Paliurus, Pomaderris, Rhamnus
Rosaceae:	Amelanchier, Aronia, Chaenomeles, Cotoneaster, X Crataegomespilus, Crataegus, X Crataemespilus, Dichotomanthes, Eriobotrya, Exochorda, Kerria, Lyonothamnus, Malus, Mespilus, Neillia, Osmaronia, Photinia, Physocarpus, Potentilla, Prunus, Pyracantha, Pyrus, Quillaja, Rhapiolepis, Rhodotypos, Rosa, X Sorbaria, X Sorbopyrus, Sorbus, Spiraea, Stephanandra, Stranvaesia
Rubiaceae:	Coprosma, Emmenopterys
Rutaceae:	Calodendrum, Choisya, Citrus, Euodia, Phellodendron, Poncirus, Ptelea, Zanthoxylum.
Sabiaceae:	Meliosma
Salicaceae:	Populus, Salix
Sapindaceae:	Alectryon, Dodonaea, Koelreuteria
Saxifragaceae:	Carpentaria, Decumaria, Deutzia, Dichroa, Hydrangea, Itea, Philadelphus, Quintinia, Ribes, Schizophragma
Scrophulariaceae:	Bowkeria, Freylinia, Hebe, Paulownia

Simaroubaceae:	Ailanthus, Picrasma
Solanaceae:	Brugmansia, Cestrum, Cyphomandra, Solanum
Staphyleaceae:	Euscaphus, Staphylea
Sterculiaceae:	Brachychiton, Firmiana
Styracaceae:	Halesia, Pterostyrax, Sinojackia, Styra
Symplocaceae:	Symplocos
Tamaricaceae:	Tamarix
Tetracentraceae:	Tetracentron
Theaceae:	Camellia, Gordonia, Schima, Stuartia, Ternstroemia
Tiliaceae:	Crinodendron, Tilia
Thymelaeaceae:	Dais, Daphne, Edgeworthia
Trochodendraceae:	Trochodendron
Ulmaceae:	Celtis, Ulmus, Zelkova
Verbenaceae:	Callicarpa, Clerodendron, Duranta, Lantana, Raphithamnus, Vitex
Violaceae:	Melicytus
Vitaceae:	Ampelopsis, Cissus, Parthenocissus, Vitis

In the original catalogue a plan of the arboretum, with overlaid grid, appeared at this point. Readers of this thesis will find a copy of that plan in thesis Appendix 2.

EASTWOODHILL ARBORETUM NGATAPA, GISBORNE

Inventory Part Three: The 'previous' collection

PLANT ACQUISITIONS ADDITIONAL TO THE CURRENT COLLECTION

**Marion MacKay
Department of Plant Science
Massey University**

**First published 1989
Revised but not re-published 1993**

Eastwoodhill Publication No 3.

This catalogue has been compiled following a comprehensive inventory of all plants at the Arboretum. Listed herein are the plants that were obtained for Eastwoodhill by W.D.Cook, but which are apparently no longer in the collection. This catalogue is a companion to the 'Catalogue of Trees, Shrubs and Climbers' (Eastwoodhill Publication No. 1), which describes the current collection.

Acknowledgements

The preparation of this catalogue was completed with the support of the Massey University Agricultural Research Foundation, The C.Alma Baker Trust, and The New Zealand Lottery Board.

The assistance of the Eastwoodhill Trust Board and associated persons is gratefully acknowledged.

Introduction

This catalogue, and its companion volume, are the result of a study initiated in 1986 on the plant material at the Eastwoodhill Arboretum. The project represents part of the inventory stage of a doctorate thesis on the botanical resource at the Arboretum, and in New Zealand, which has been initiated at the Department of Horticultural Science at Massey University.

Eastwoodhill is 35km from Gisborne in a relatively isolated rural area. Information on the Arboretum and the current collection can be found in the companion volume 'Catalogue of Trees, Shrubs and Climbers.' The collection was the work of the late W.D.Cook, horticulturist, of Gisborne. During his lifetime he imported some 5000 different species and cultivars of plants for his Arboretum. About 2500 exist today, a total of about 8000 trees in all. This document attempts to compile a record of those plants which were purchased but which no longer exist in the collection today.

The information for this document was gathered from the notes made by Cook in his reference books. The main reference he used for this purpose was W.J.Bean's 'Trees and Shrubs Hardy in the British Isles' of which he had two sets, a 5th edition and a 7th edition. In these he noted the date of purchase and source of incoming plants. Occasional notes also appear in other books, but on the whole these corroborate the former.

The coding for the books in this catalogue is used to distinguish between the two sets of the text, 'EWH' referring to the set held at the Arboretum, and 'lib' referring to the set held in the library collection. The codes I, II and S are used to indicate the volume number, S indicates the supplement of the 5th edition.

Many of the entries in this catalogue are taken from hand written notes in the aforementioned books, and the legibility of some of the original entries is difficult. Therefore it is likely that there are errors in some of the dates, particularly it was hard to distinguish 3 and 5 in many cases.

In some cases plants are recorded in this list that also occur in the current catalogue. In these cases additional information has been found, for example record of another source or date of importation. These entries are indicated by an '+'.

The scientific names are those used in the editions of Bean in question. As much as possible these are cross referenced to names in current usage.

I wish to thank the Trust Board for their cooperation for the duration of this project.

Marion MacKay, 1989, 1993.

Sources of plant material

Bod	presumably Bodnant, Great Britain.
D, D&D	Duncan and Davies Nursery, New Plymouth, New Zealand.
Goodwin	Jack Goodwin, then Director of Parks, New Plymouth, New Zealand.
G	Goudie's Nursery, New Zealand.
Horton	Hortons Nursery, New Zealand.
H&S, or Hill	Hillier and Sons, Winchester, England.
HZ	unknown.
IH	unknown.
J	unknown.
M, or Massey	New Zealand Rhododendron Association Nursery, then at Massey University, Palmerston North, New Zealand.
McK	probably Ian McKean, Rangiwahea, New Zealand.
P	possibly F.C.Puddle, of Bodnant, Great Britain.
Russell	either Russell Cook of Hawkes Bay, or Russell Mathews of New Plymouth, New Zealand.
S	unknown.
Slocock	Slocock Nursery, England.
Stevens	Stevens Nursery, New Zealand.
Walker	probably Walkers Nursery, Mayfair, Hastings, New Zealand.
Webb	Webbs Nursery, New Zealand.
Wilson	Wilsons Nursery, Christchurch, New Zealand.

Method of listing in this catalogue

Scientific name. Country of origin. Source of purchase. Reference book from which the information came.

For example;

- Abelia floribunda* Mexico. S1938,39,D&D1939,S1941; (Bean I lib)
- + *Abelia grabneriana* China. D1937, (Bean S lib)
- + *Abelia x grandiflora* Hort. H&S1948 (Bean I lib)

'+' Indicates a plant for which there is already a listing in the current catalogue. The entry in this document therefore represents either (i) further purchases by Cook, or, (ii) a purchase in the Cook era which no longer exists, the current catalogue entry representing another purchase. 'Name not confirmed' or 'NNC' after a plant name indicates a name that may not be valid, as that name has not yet been found in the literature.

Genera of plants in this document that are not in the current catalogue

21 additional families, 211 additional genera

GYMNOSPERMAE: No additional families, 5 additional genera.

Coniferales

Cupressaceae:	Callitris, Fitzroya, Fokenia
Podocarpaceae:	Saxegotheca
Taxodiaceae:	Athrotaxis

ANGIOSPERMAE: 21 additional families, 206 additional genera.

Monocotyledonae

Agavaceae:	Nolina
Liliaceae:	Dianella, Ruscus
Poaceae:	Bambusa

Dicotyldonae

Aceraceae:	Dipteronia
Acanthaceae:	Jacobinia, Mackaya, Ruellia
Actinidiaceae:	Actinidia
Anacardiaceae:	Harpophyllum, Smodingium
Apiaceae:	Bupleurum
Apocynaceae:	Carissa (Arduina), Mandevilla, Plumeria, Vinca,
Araliaceae:	Acanthopanax, Brassaia, X Fatshedera, Panax
Asclepiadaceae:	Asclepias, Stephanotis
Asteraceae:	Artemesia, Cassinia, Chilotrichum, Eriocephalus, Montanoa, Mutisia, Ozothamnus
Bombaceae:	Fremontia
Bruniaceae	Berzelia
Byttneriaceae:	Dombeya, Reevesia,
Caesalpiniaceae:	Bauhinia, Caesalpinia, Parkinsonia, Poinciana, Schotia,
Campanulaceae:	Canarina
Caprifoliaceae:	Leycesteria, Symphoricarpos,
Chenopodiaceae:	Atriplex
Cistaceae:	Halimium, X Halimiocistus
Combretaceae:	Combretum, Quisqualis
Convolvulaceae:	Ipomoea, Quamoclit
Cornaceae:	Corokia
Cunoniaceae:	Weinmannia
Cyathaceae:	Hemitelia

Diapensiaceae:	Shortia
Ebenaceae:	Royena
Ericaceae:	Andromeda, Azalea, Calluna, Cassandra, Daboecia, Leiophyllum, Menziesia, Pentapterygium, Pernettya, Phylodoce, X Phyllothamnus, Rhodothamnus, Zenobia
Euphorbiaceae:	Baloghia, Homalanthus
Eupteleaceae:	Euptelea
Flacourtiaceae:	Scolopia, Xylosma
Gesneriaceae:	Mitraria, Rhabdothamnus,
Hamamelidaceae:	Sinowilsonia
Icacinaceae:	Villaresia
Lamiaceae:	Perovskia, Spacele
Lardizabalaceae:	Sinofranchetia
Lauraceae:	Beilschmiedia, Lindera
Malpighiaceae:	Galphimia
Malvaceae:	Plagianthus
Mimosaceae:	Prosopis
Monimiaceae:	Laurelia
Moraceae:	Maclura
Myricaceae:	Comptonia
Myrsinaceae:	Ardisia
Myrtaceae:	Agonis, Backhousia, Beaufortia, Calytrix, Eugenia, Hypocalymma, Lhotskya, Psidium, Syncarpia, Thryptomene
Nyctaginaceae:	Bougainvillea
Oleaceae:	Phillyrea
Papavaceae:	Dendromecon
Papilionaceae:	Adenocarpus, Anagyris, Anthyllis, Barklya, Brachysema, Caragana, Carmichaelia, Chordospartium, Chorizema, Colutea, Coronilla, Crotalaria, Desmodium, Halimodendron, Hovea, Lathyrus, Maackia, Notospartium, Podalyria, Psoralea, Pultenaea, Swainsonia, Ulex, Viminaria
Philesiaceae:	Lapergeria, X Philageria, Philesia,
Pittosporaceae:	Billardiera
Plumbaginaceae:	Plumbago
Polemoniaceae:	Cantua
Polygalaceae:	Polygala
Polygonaceae:	Polygonum
Proteaceae:	Braebejum, Dryandra, Gevuina, Hakea, Lambertia, Leucadendron, Leucospermum, Persoonia, Petrophila, Stenocarpus, Telopea,
Rhamnaceae:	Colletia, Zizyphus
Rosaceae:	Docynia, Heteromeles, Holodiscus, Neivisia, Peraphyllum, Rubus, X Sorbaronia,
Rubiaceae:	Alberta, Bouvardia, Gardenia, Leptodermis, Luculia, Manettia, Mussaenda, Posoqueria, Rondeletia
Rutaceae:	Acradenia, Adenandra, Boronia, Casimiroa, Coleonema, Correa, Diosma, Eriostemon, Murraya, Orixia, Phebalium, Skimmia
Sapindaceae:	Harpullia, Xanthocerus
Saxifragaceae:	Anopterus, Bauera, Fendlera, Pileostegia, Ungnadia

Schisandraceae:	Kadsura
Scrophulariaceae:	Dermatobotrys, Diplacus, Jovellana, Phygelius, Russelia
Solanaceae:	Brunfelsia, Datura, Fabiana, Lochroma
Styracaceae:	Alniphyllum
Tamaricaceae:	Myricaria
Theaceae:	Cleyera
Tiliaceae:	Grewia, Luehea
Thymelaeaceae:	Pimelia
Tropaeoleaceae:	Tropaeolum
Urticaceae:	Debregeasia
Verbenaceae:	Caryopteris, Citharexylem, Holmskioldia, Lippia, Verbena,
Winteraceae:	Drimys

Not assigned Corysema, Panay

Plants noted by W D Cook as having been in the collection.

The numbers in brackets represent Species + Cultivars. (Only species and cultivars additional to the current collection, i.e. those marked '+' are not counted as that species or cultivar has already been counted in the current collection under another acquisition)

Abelia: Caprifoliaceae (6+0)

Azalea

Azalea listings have been derived from Douglas Cooks catalogue of 1965, plus his notebooks on the collection. The azalea list generated from these sources is corroborated by markings in his copy of the International Rhododendron Register 1958. Unfortunately said markings do not give sources of plant material.

Azalea (0+386)

- ‘Ada’ (Name not confirmed). (Cook 1965).
- ‘Ada Brunieres’ (Knap Hill). (Cook 1965).
- ‘Addy Wery’ (Kurume). 1959, (RR1958).
- ‘Adolphe de Haens’ (Name not confirmed). (Cook 1965).
- ‘Aida’ (Rustica). (Cook 1965).

Robinia: Fabaceae - Papilionaceae (4+0)

- hispida* N.America. W1935, (Bean II lib)
- kelseyi* N.America. W1935, (Bean II lib)
- luxurians* N.America. H&S1947, (Bean II lib)
- zanthina* (Name not confirmed) H&S1950, (Bean II lib)

Rondeletia: Rubiaceae (2+0)

- amoena* Mexico, Guatamala. (Cook 1965)
- strigosa* Guatamala. HZ1949, (Bean II lib)

Rosa: Rosaceae (12+3)

- banksiae* China. D1942, (Bean II lib)
- caudata* China. S1939, (Bean S lib)
- cinnamomea (majalis)* Europe, Asia. S1938, (Bean II lib)
- davidii* China. S1939, (Bean S lib)
- helenae* China. H&S1948, (Bean II lib)
- 'Highdownensis'* Hort. S1937, (Bean II lib)
- macrophylla 'Flore Plena'* (Cultivar not confirmed) Himalaya. S1940, (Bean II lib)
- microphylla 'Flore Plena' (roxburghii 'Flore Plena')* China. S1939, (Bean II lib)
- moschata* Asia. S1937, (Bean II lib)
- multibracteata* China. IS1941, (Bean S lib)
- pomifera (villosa)* Europe. S1940, (Bean II lib)
- rubrifolia (glauca)* Pyrenees, Yugoslavia. S1935, (Bean II lib)
- sweginzowii* China. IS1937, (Bean S lib)
- webbiana* Himalaya, Turkestan. S1938, (Bean II lib)
- xanthina* China, Korea. S1937, (Bean S lib)

Rosmarinus: Lamiaceae (0+7)

- officinalis* Asia minor.
- 'Albiflorus'* (RHS 4,EWH)
- 'Benenden Blue'* (Cook 1965). 1962, (Bean EWH)
- + *'Corsican Blue'* H&S1950, (Bean II lib)
- 'Fastigiatus' ('Miss Jessups Upright')* (Cook 1965). Hill1946, (Bean II lib)

‘Humilis’ (‘Prostratus’) (Cook 1965)

‘Prostratus’ D&D1928, (Bean II lib)

‘Severn Sea’ (Cook 1965). 1962, (Bean EWH)

‘Tuscan Blue’ H&S1950, (Bean II lib)

‘White Albus’ (Name not confirmed) (Cook 1965)

Royena: *Ebenaceae* (1+0)

lucida S.Africa. (RHS 4,EWH)

Rubus: *Rosaceae* (3+0)

deliciosus N.America. S1935, (Bean II lib)

lasiostylus China. H&S1947, (Bean II lib)

trilobus Mexico. H&S1950, (Bean II lib)

Ruellia: *Acanthaceae* (1+0)

macrantha Brazil. H1947, (Bean II lib)

Ruscus: *Liliaceae* (2+0)

aculeatus Europe, France, Iran. Wilson 1939, (Bean II lib)

racemosus (*Danae racemosus*) Syria, Iran. (RHS 4,EWH)

Russelia: *Scrophulariaceae* (2+0)

sarmentosa Cuba, Mexico, Columbia. HZ1949, (Bean II lib)

juncea (equisitiformis) Mexico. (Bean II lib)

Salix: *Salicaceae* (28+5)

acutifolia Russia to E.Asia. H&S1950, (Bean II lib)

alba ‘Argentea’ (alba f.sericea) Europe, Asia. H&S1947, (Bean II lib)

alba ‘Britzensis’ (Cook 1965)

alba ‘Chrysostela’ (Cook 1965)

bactrina (Name not confirmed) H&S1948, (Bean II lib)

balsamifera (pyrifolia) N.America. (Cook 1965). Berry 1960, (Bean EWH)

+ *daphnoides* Europe, Himalaya. Slocock 1938, (Bean II lib)

daphnoides ‘Aglaia’ H&S1947, (Bean II lib)

expandra (Name not confirmed) Slocock 1938, (Bean II lib)

fargesii China. H&S1946, (Bean S lib)

fragilis Europe, Orient. S1947, (Bean II lib)

gatungensis (Name not confirmed) H&S1948, (Bean II lib)

gigantea (Name not confirmed) G1947, (Bean II lib)

x grahamii (aurita x herbacea x repens). Scotland. H&S1946, (Bean S lib)

hexandra (x ehrhartiana) (*alba x pentandra*). Europe. H&S1948, (Bean II lib)

hypoleuca China. H&S1948, (Bean II lib)

irrorata N.America. H&S1947, (Bean II lib)

lanata Artic and subartic Europe and Asia. H&S1948, (Bean II lib)

+ *magnifica* China. S1937, (Bean II lib)

+ *matsudana ‘Tortuosa’* China. Goodwin 1946, (Bean S lib)

medemii (aegyptiaca) Armenia, Iran. H&S1947, (Bean II lib)

x meyeriana (fragilis x pentandra). Europe. H&S1947, (Bean II lib)

nigra N.America. Slocock 1938, (Bean II lib)

nigricans (myrsinifolia) Europe, Asia minor, Siberia. Berry 1960, (Bean EWH)

nigricans fosteriana (Name not confirmed) Berry 1960, (Bean EWH)

- opaca (sachalinensis)* Japan. Berry 1960, (Bean EWH)
paptederana (Name not confirmed) (Cook 1965)
purpurea (Name not confirmed) (Cook 1965)
ptheri (Name not confirmed) (Cook 1965)
piperi N.America. Berry 1960, (Bean EWH)
purpurea 'Nana' Europe, N.Africa. (Bean II lib)
rosmarinifolia (repens var. rosmarinifolia) Europe. Slocock 1938, (Bean II lib)
x salamonii (x sepulcralis 'Salamonii') France. Slocock 1938, G1947, (Bean II lib)
silesiaca Carpathian and Balkan mtns. (Cook 1965). Berry 1960, (Bean EWH)
sitchensis N.America, Alaska. (Cook 1965)
vininalis Asia, Himalaya. G1947, (Bean II lib)

Salvia: Lamiaceae (3+0)

- + *grahamii (microphylla)* Mexico. H1946, (Bean S lib)
- rutilans* Mexico. H&S1947, (Bean II lib)
- x superba* Hort. RHS1962, (RHS 4, EWH)
- violacea* (Name not confirmed) D1946, (Bean II lib)

Sambucus: Caprifoliaceae (0+4)

- canadensis 'Aurea Variegata'*
nigra Europe, N.Africa, W.Asia.
 'Aurea' Goodwin 1946, (Bean II lib)
 'Aurea Variegata' ('Luteovariegata') H&S1937, (Bean II lib)
racemosa 'Serratifolia Aurea' ('Plumosa Aurea') England, Scotland.

1.0 SUMMARY

The Eastwoodhill Arboretum is a unique resource in New Zealand. To ensure that the Arboretum realises its potential, management should emphasise, develop and maintain those things that project Eastwoodhill into the future as a collection of international merit.

As a first step in botanical planning for the Arboretum, the inaugural Eastwoodhill workshop considered the composition of Eastwoodhill by assessing the present collection and considering the future development of the collection.

Summary of recommendations

- That the future development of the Arboretum should be consistent with the roles outlined in section two.
- That a more detailed assessment of the collection should be carried out.
- That the future direction of the collection should be that of cool temperate and warm temperate flora, based on the key genera that have been highlighted.
- That the plant material acquired for the collection should have qualities such as botanical interest, rare and endangered, aesthetic interest, so as to provide a memorable experience for visitors.
- That the Trust Board should be proactive in the area of land management with trees.
- That planting of the unstable areas within the new 150 acres should be attended to with urgency.
- That appropriate South American flora be included in the collection.
- That the collection should include plant material that demonstrates the climatic advantage of the Arboretum, and species suitable for climate change conditions in New Zealand.
- That selected cultivars may be included in the collection.
- That the native area be included into the surrounding planting.
- That site selection is the first criterion for planting, other factors such as geographical association, aesthetic merit, seasonal features, should be secondary considerations.
- That the Arboretum should join the IUCN and establish other relevant international contacts.
- That the tree evaluation system should be continued as a mechanism to aid tree management decisions.
- That the workshop group should meet again in April 1990 to continue the consideration of the collection and its further development.

2.0 THE ROLE OF THE ARBORETUM

2.1 The role of the Arboretum

To maintain and further the collection of Douglas Cook:

- Eastwoodhill would not exist without the efforts of Douglas Cook. Therefore there is an obligation to continue the theme that he began, (see below, theme of the collection).
- The extension of this theme into some of the compatible warm temperate flora will make Eastwoodhill a more dynamic concept and help to put the Arboretum on the international map.
- Those plant groups that have done well should be filled out.

To encourage visitors of a scientific and public nature:

- Scientific visitors will enhance the international reputation.
- The 'public' however, will be the sustaining base of visitors.

To be an educational resource:

- For the general public, raising awareness of trees and the environment.
- For particular areas of education, e.g. local school children, university.
- As an educational focus at all levels.
- As a demonstration of the use of trees.

To conserve plant material:

- The New Zealand resource.
- As a repository for conserving endangered species, particularly the warmer climate (warm temperate) material that northern arboreta cannot grow.

To be proactive in the area of land management and soil conservation planting:

- Eastwoodhill represents an opportunity to be proactive in the area of soil conservation planting, land management, and landscape trees.

To act as an international liaison point for botanical matters in New Zealand:

- Eastwoodhill must be put on the international botanical map.
- A link with the IUCN (International Union for the Conservation of Nature and Natural Resources), particularly through the Botanic Gardens Secretariat at Kew should be established.
- As many overseas contacts must be made as possible. The Botanic Gardens Secretariat will be a key contact here as their newsletter is circulated to over 200 botanic gardens throughout the world.

2.2 Tourism versus scientific roles

The general public are the sustaining base of visitors to the Arboretum and therefore must always be catered for. However the unique character of the place as a special botanical collection must never be compromised. Therefore the level of intense tourism must be controlled.

Eastwoodhill is the opportunity for a unique recreational experience. The quality of the experience must be preserved, but the property still be accessible to the general public. Control of vehicular access is the easiest way to exert such control. Perhaps Eastwoodhill should be the regional park for Eastland.

Use by the public:

- Eastwoodhill is not user friendly.
- The ‘centre’ of the property is not easily identified.
- Autumn is the season that attracts most outside visitors. Spring is mostly locals, many of whom do not pay. It is very quiet over Christmas.
- To create a memorable experience for the public the Arboretum must include planned impact display areas. Plantings such as the Magnolias on Orchard Hill are the type of thing, but more of this is required. A range of different features at different times is desirable.
- The entrance is puny, it should be large and welcoming.
- Young people must be encouraged to Eastwoodhill.

2.3 Educational and Scientific roles

These types of visitors are governed by the types of plants that are here. To be very special and attract these visitors Eastwoodhill should pursue the existing theme of northern temperate material, including botanically interesting material, rare and endangered material, plus warmer temperate material that follows the already mentioned theme. This puts the Arboretum in a good international position with material that northern arboreta cannot grow, and material that the Botanic Gardens Secretariat is looking for sites for. Eastwoodhill should be promoted as special because of this combination of plant material.

Recommendation: That the future development of the Arboretum should be consistent with the roles outlined in section two.

3.0 PRESENT STATUS OF THE COLLECTION

3.1 Historical perspective

The Arboretum today is largely a collection of northern temperate flora, and as such represents the survivors of Cook’s collecting efforts. It is important to note that apparently Cook collected anything he could obtain. This conjecture is supported by the data on the plants that he purchased, but which are no longer in the collection. This data can be seen in the ‘Plants Purchased’ list. {Thesis Appendix Three}

3.2 Key elements of the present collection.

The backbone of the present collection is identified by a core group of plant genera. These are:

Acer, Aesculus, Alnus, Betula, Conifers (all), Fagus, Ilex, Juniperus, Malus, Magnolia, Prunus, Pyrus, Quercus, Tilia.

3.3 Arboretum theme

It was agreed that the theme of the Arboretum was that of temperate and warm temperate flora, focussing on the key plant groups that have already been identified. On the basis of the temperate theme it was decided that New Zealand plants did not rate as part of the character of the place. Geographically the collection is 77% northern hemisphere origin and 16% southern hemisphere origin, (7% horticultural origin).

3.4 Assessment of the collection

The initial assessment of the collection was done by ranking the collection by genus group. Each participant was asked to give two scores to each genus group. The first score was a botanical rating, which aimed to give an indication of the botanical interest of the genus in question. The second score was an aesthetic rating, which aimed to give an indication of the visual interest of the group in question. Thus plants that were considered botanically interesting but not interesting to look at, and vice versa, could be distinguished. The mean of scores from all participants would give an indication of the importance of each plant group. Each genus has a score out of ten for each attribute (botanical and aesthetic). Results of the initial assessment can be seen in the workshop documents. {Assessment results were included in the Background information booklet provided to the participants. Readers of this thesis will find the assessment results in thesis Appendix Eight.}

Assessment results

After consideration of the assessment results it was agreed that plants that had scored 6/10 or above should be kept in the collection, and that plants that had scored 8/10 or above were worth pursuing.

In terms of the criteria for the survey it was agreed that the botanical and aesthetic ratings were suitable. Mr Clapperton equated the botanical score to scientific interest and the aesthetic score to popular interest. However some sort of longevity index might be added to indicate those plants that would be long term subjects in the collection.

The survey should allow for space to include notes on additional families, genera and species that are not currently on the list.

The catalogue, for completeness, needs height measurements for the trees. This was agreed, but recognised as a big job.

Continuation of the assessment

It was agreed that the Arboretum should be assessed in more detail by undertaking the survey of the whole catalogue, beginning with the key genera identified. This would provide information on which to base decisions on tree acquisition, tree removal, and propagation priorities.

Recommendation: That a more detailed assessment of the collection should be carried out.

4.0 DEVELOPMENT OF THE COLLECTION

4.1 Proposed Future Direction

The unanimous opinion of the workshop group was that the theme developed by Douglas Cook should be continued and extended. Eastwoodhill exists because of the vision of Douglas Cook and therefore there is an obligation to continue in the manner in which Cook started.

The theme developed by Cook has already been identified as temperate flora. His policy was to purchase anything that was available. It is logical to follow this pattern by taking the warmest and coolest ends of temperate flora that will grow here and filling in in-between, at the same time focussing on the theme genera of the collection.

Within this theme plants collected should be broad leaf and coniferous species that are appropriate to this area, i.e. those that grow well at Eastwoodhill. Plants from geographical ranges that would be suitable for Eastwoodhill but which are not well represented here could be filled in.

The collection of warm temperate species, within the context of the key genera, was seen as a main attraction to visitors. However the acquisition of these species must be selective, for example, it was seen as appropriate to collect *Magnolia* and *Manglietia* as these were already identified as a key group at the arboretum.

It was essential that the arboretum be unique as a collection. This would ensure its standing as a place worth visiting.

Recommendation: That the future direction of the collection should be that of temperate and warm temperate flora, based on the key genera that have been highlighted.

Recommendation: That the plant material acquired for the collection should have qualities such as botanical interest, rare and endangered, aesthetic interest, so as to provide a memorable experience for visitors.

4.2 The range of plants

While discussing the range of plant material that might be grown at Eastwoodhill it became apparent that there were three areas for discussion. These were: plants for conservation purposes, South American plants, climate change.

Soil conservation

In the Gisborne area soil erosion and soil conservation planting will continue to be an important aspect of land management.

Traditionally, soil conservation planting has concentrated on poplars and willows, because they work well. But this is not the sort of role that Eastwoodhill should take in soil conservation planting. The Arboretum must be proactive in the area of its greatest strength, i.e. the range of plant material that it holds. For example, *Abies religiosa* grows very rapidly, and some of the Mexican oaks are very resistant to wind, therein lies the opportunity to be a leader in the area of soil conservation planting development. Certainly the poplars and willows should still be used, but the long term strategy should be in new plant material.

The Arboretum has a potentially very important role as a botanical repository with an extension in land management using trees.

Recommendation: The Trust Board should aim to be proactive in the area of land management with trees.

Recommendation: The planting of unstable areas within the new 150 acres should be attended to with urgency.

South American Plants

The plants of Chile are in harmony with the Eastwoodhill concept. In fact Cook did collect South American material but a majority of it did not survive due to poor siting. There are not a large number, *Nothofagus* is

one of the biggest groups. The inclusion of the appropriate Chilean flora will provide an evergreen element, and be climatically suitable.

Recommendation: That appropriate South American flora be included in the collection.

Climatic advantage

The climatic situation of Eastwoodhill could be a significant drawcard to international visitors in that species can be grown here that cannot be seen in the northern hemisphere arboreta. For example, *Lithocarpus* and *Quercus* from southern China. The abundance of species that can be grown here should be a selling point.

In a similar vein there is likely to be an opportunity for Eastwoodhill to demonstrate a range of plant material suitable for dry areas under a situation of climate change and global warming. Species that may be suitable for New Zealand in that situation could be grown at Eastwoodhill, for example, species from xerophytic climates which fit the collection pattern.

Recommendation: That the collection should include plant material that demonstrates the climatic advantage of the Arboretum, and may demonstrate species suitable for climate change conditions in New Zealand.

4.3 Cultivars

After discussion it was concluded that a selected range of cultivars was acceptable. The suggested criteria were that the plant should have some impact, but not be too far from the type, and blend in for the majority of the season. Cultivars of species and first cross hybrids were preferable. Only the best should be chosen.

Recommendation: That selected cultivars may be included in the collection.

4.4 New Zealand Native Plants

The present native area is an incongruous element in the Arboretum. It was agreed that natives are best demonstrated in one of two ways: either endemic plants which are best portrayed as a remnant, or those plants used to demonstrate a range, e.g. representatives of *Nothofagus*. The latter should be incorporated into the collection and not left to stand as a separate grouping.

The native area at Eastwoodhill, in its present form, is neither of these ways of demonstrating native flora. Because of the planting pattern it will never demonstrate a typical plant association. There is no point in allowing a part of Eastwoodhill to naturally regenerate, there is an area of bush in the rear of the property that should be more suitable. Because of the pattern of mostly evergreen material in the native area it is not visually compatible with the rest of the Arboretum.

Recommendation: That the native area be incorporated into the surrounding planting. Its main role should be to show the comparison between New Zealand flora and the overseas flora in the same genera. Genera such as *Nothofagus*, *Podocarpus*, and *Libocedrus* are plants of this sort. The link to Chilean species can be well demonstrated here.

4.5 Planting criteria

The first criteria for planting an area should be the suitability of the plant for the site, then other criteria can be considered. It was agreed that planting in geographical groups was acceptable, but only if the plants suit the site.

Recommendation: That site selection is the first criteria for planting; other factors such as geographical association, aesthetic merit, and seasonal features should be secondary considerations.

4.6 Establishment of an international profile

The international reputation of the Arboretum is a critical issue in its future development. It was seen that the future standing of the Arboretum in scientific and botanical circles would be greatly enhanced if the uniqueness of the collection could be strengthened.

The Arboretum has two important advantages in establishing an international profile.

1. Northern temperate material is easier to grow in this climate which is more favourable than northern hemisphere sites. Similar plants can be grown though.
2. The more important advantage though is the ability to grow at Eastwoodhill plants of warm temperate origin. These cannot be grown in northern hemisphere sites, and the IUCN is looking for sites to preserve these types of plants.

Already a preliminary liaison with the IUCN has been established and the catalogue is being sent to be processed to identify rare and endangered plants.

Recommendation: That the Arboretum should join the IUCN and establish other relevant international contacts.

5.0 TREE MANAGEMENT STRATEGIES

5.1 Tree assessment method

One of the difficulties in tree management is developing a rational method of decision making. Usually there is no mechanism for quantifying tree quality or desirability, and therefore formulating a basis on which to make decisions.

For the purposes of this workshop a tree rating system was developed which would assist in targeting tree management decisions. First, participants were asked to give each tree in the area to be considered a botanical and aesthetic rating, as had been done in the assessment of the catalogue. These scores were averaged to give an opinion on each tree as to its merit.

At the problem site the trees were then ranked again to arrive at a score for the tree at that particular site. The information provided by the rankings would provide the basis from which to decide the action that should be taken with that particular specimen. For example, a tree that is botanically very desirable but which is in poor health on that site can be targeted for propagation. Conversely a botanically ordinary tree that is doing well on the same site could be sacrificed to provide better conditions for the more desirable tree.

5.2 Example problems

The Pear Park Problem

In this portion of Pear Park there are a number of unrelated trees that are too close together, most of which have high botanical ratings. After the site ranking were done and some discussion held the following suggestions were put forward:

<i>Acer opalus</i>	propagate and remove.
<i>Acer pseudoplatanus</i>	remove.
<i>Acer platanoides</i> 'Reitenbachii'	check ID, propagate if special, otherwise repurchase and replant.
<i>Acer velutinum</i> var <i>vankempi</i>	remove.
<i>Aesculus glabra</i>	propagate and resite.
<i>Aesculus hippocastanum</i> 'Pyramidalis'	remain as is, propagate.
<i>Aesculus plantierensis</i>	remain as is.
<i>Crataegus x grigoniensis</i>	propagate, remove when established elsewhere.
<i>Crataegus mollis</i>	propagate and site elsewhere.
<i>Crataegomespilus dardarii</i>	urgent propagation, check.
<i>Crataemespilus grandiflora</i>	remain as is, but propagate and resite nearby.
<i>Cunninghamia lanceolata</i>	remove.
<i>Cunninghamia konishii</i>	propagate, bring in new stock.
<i>Malus hupehensis</i>	remove.
<i>Platanus cantabrigiensis</i>	remain as is, propagate.
<i>Platanus cuneata</i>	remain as is, propagate.
<i>Platanus occidentalis</i>	remain as is.
<i>Platanus orientalis</i>	remain as is, propagate.
<i>Populus nigra</i> 'Italica'	remove.
<i>Quercus acutissima</i> ssp. <i>chenii</i>	propagate and resite, propagation of this species is difficult.
<i>Quercus hodgekinsonii</i>	leave the middle one, remove others.
<i>Quercus x ludoviciana</i>	remain as is, propagate.
<i>Quercus marilandica</i>	remain as is, propagate (difficult).
<i>Quercus variabilis</i>	remain as is for the moment, establish a group elsewhere then remove this group.
<i>Tilia petiolaris</i>	remain as is, plant elsewhere as well.

Given these decisions the restructured area would concentrate on the Plane trees and the oaks, with some hawthorn. {These plants can be found in grid squares D12 and E12 of plan 2 in thesis Appendix Two.}

This exercise highlighted the need to refine the site ranking procedure. The site ranking could clearly be divided into two portions, a health/survival factor, and a desirability in the composition factor. This was incorporated into the problem for the afternoon.

The Orchard Hill Problem

On Orchard Hill there are a number of related trees, many of which have a high botanical score, but which are too close together, and not always of good health. For this problem the site rating was divided into two portions: the survival factor, and the desirability factor.

The conclusions were as follows:

<i>Abies amabilis</i>	Low scores. Try this species again on a better site that is moist but well drained, a shaded gully would be better. Remove this tree from this site once re-established elsewhere.
<i>Abies bracteata</i>	This plant is from a hot dry place and is quite suitable for this site. Leave. In fact this is the best of the Abies here.
<i>Abies 632 (concolor)</i>	Remove.
<i>Abies concolor</i>	Retain for now, this species should be good for Eastwoodhill for gravelly soils.
<i>Abies concolor</i> 'Candicans'	Retain and propagate from the fallen tree.
<i>Abies concolor</i> 'Glauca'	Retain.
<i>Abies firma</i>	Retain.
<i>Abies georgiana</i>	This is a poor specimen, reintroduce from Mr Gordon and then remove this tree.
<i>Abies 631</i>	Retain.
<i>Abies 633</i>	Remove.
<i>Abies holophylla</i>	Retain.
<i>Abies numidica</i>	Retain.
<i>Abies spectabilis</i> var. <i>brevifolia</i>	Not a good specimen but worth trying here, re-introduce.
<i>Abies veitchii</i>	Retain.

Abies should be planted at the base of the hills in a moisture band. Use *Betula* as a nurse tree to get conifers started. *Alnus* is another useful one as it gives nitrogen as well. Ron Gordon has used lombardy poplar for the same purpose. *Betula* was thought to be a good ecological combination, good at low pH. The important *Abies* should be replanted at more suitable sites. Orchard Hill should be replanted with the dry climate ones, whilst still retaining the character of the Hill. {*Abies* can be found in grid squares K10 and L10 of plan 4 in thesis Appendix Two. *Picea* can be found in grid squares L11 and L12 of plan 5 in thesis Appendix Two.}

<i>Picea bicolor</i>	Retain. The douglas fir above is a problem.
<i>Picea complanata</i> f. <i>latisquamea</i>	Retain.
<i>Picea koyamii</i>	Retain, the pine nearby is a problem, but the pine is also important.
<i>Picea morrisonicola</i>	This tree may be the only one in the country and therefore should be retained. The Douglas fir above must be removed.
<i>Picea obovata</i>	A tiny plant squashed under others. A very poor tree but not available in NZ. Leave and propagated urgently.
<i>Picea orientalis</i>	Retain.
<i>Picea brachytyla</i>	Marginal, not thrifty, retain.
<i>Picea sitchensis</i>	Remove the smaller one, retain the larger one.
<i>Picea spinulosa</i>	Retain but remove the associated Douglas fir.

Picea wilsoni

Remove. This tree needs much more cold than it is getting here and will not do well here. Easily available so remove.

It was agreed that the method of tree evaluation and therefore decision making was a particularly worthwhile exercise and that this could be used throughout the arboretum. It will be a useful method to assist management of the existing trees in problem areas.

Recommendation: That the tree evaluation system should be continued as a mechanism to aid tree management decisions.

6.0 CONCLUSION

It was agreed that the workshop had been a worthwhile exercise and that useful recommendations had arisen from the discussion. Particularly the group wished to emphasize the value of planning and discussion for the development of the Arboretum. The participants felt that the level of consensus arrived at was gratifying and that the further consideration of the collection should be an ongoing thing.

Recommendation: That the workshop group should meet again in April 1990 to continue the consideration of the collection and its development.

7.0 APPENDICES

APPENDIX ONE - PROGRAMME

Workshop objective: A preliminary assessment of the Eastwoodhill collection, and the consideration of a system for decision making on tree management.

Saturday 17 June

9.00am	Welcome and introduction
9.15-10.15am	Assessment of the collection. Consideration of survey results
10.30-12.00	Assessment of the collection. Consideration of survey results
1.00-2.45pm	Tree management - Pear Park
3.00-5.00pm	Tree management - Orchard Hill
7.00pm	Dinner and meeting with the Trust Board

Sunday 18 June

9.00-10.30	The function of an arboretum
10.45-12.00	Wider prospects, plants not present at Eastwoodhill
1.00pm	Workshop summary

Appendix 6

Report of the second workshop

Photinia davidsoniae, Corner Park, December 1989.

Footnote: The workshop report in this thesis has been slightly modified from the original. Format has been modified slightly for this thesis. Content has been modified with respect to the maps of Pear Park that were in the original report. In this version the maps are not included but the reader is referred to the maps of Pear Park in thesis Appendix Two. Content has also been modified to ensure that the reader of this thesis can access all of the information that was provided to the workshop participants. Thus, some information that was in the Background Information booklet for the participants (but not in the original report), has been placed in the report version in this thesis. The programme has been added as an extra appendix. Tables 2.6, 2.7, 3.4, 3.5, 5.1, 5.2, 5.3, 5.4 are additional to the original report but were in the Background Information Booklet.

Resume

In April 1990 the Eastwoodhill Plant Management Committee met for the second time to consider aspects of the management and development of the collection of plants at the Eastwoodhill Arboretum. These deliberations are consequent to the first workshop which completed a preliminary evaluation of the collection.

Further consideration of the key genera of the collection achieved a refinement of the list of plant genera identified as most important to the character of the Arboretum. A detailed analysis was given to the genus *Magnolia* which had been identified as one of the most important of these genera. A development plan for this genus at Eastwoodhill was formulated.

A third exercise tested a park evaluation and planning method, using Pear Park as the example. The current plantings in this park were considered in light of the character and objectives for the park. The park was examined in detail and trees assessed for a variety of factors which were then used as a basis for planning decisions. The result of this exercise is the development of a long term strategy for the park.

Two exercises were conducted to introduce the areas Basinhead, and the Bush area, which will be the subject of further development reviews in the future.

This workshop was conducted under the auspices of the Eastwoodhill Arboretum Trust Board.

SUMMARY OF RECOMMENDATIONS

Section One: Issues

That the Plant Management Committee should establish liaison with the Douglas Cook Centre for Education.

Section Two: Key Genera

That *Camellia*, *Crataegus*, *Fraxinus* and *Populus* (species only), be added to the list of key genera and *Cedrus*, *Cupressus*, *Juniperus* and *Pinus* be the key conifer group.

That the redefined key genera list (present) now includes:

Acer, *Aesculus*, *Alnus*, *Betula*, *Camellia*, *Cedrus*, *Crataegus*, *Cupressus*, *Fagus*, *Fraxinus*, *Ilex*, *Juniperus*, *Malus*, *Magnolia*, *Pinus*, *Populus* (species only), *Prunus*, *Pyrus*, *Quercus*, *Tilia*.

That *Celtis* (and *Ulmaceae*), *Theaceae*, *Magnoliaceae*, *Callitris*, *Keteleeria*, *Podocarpus*, *Taiwania*, and *Taxodiaceae* be considered as potential future key genera.

That the acquisition policy for key genera groups should, in the absence of a specific genus plan, be the acquisition of all species where possible. If a species does not succeed at Eastwoodhill then an herbarium sample should be held.

That the acquisition policy for non key genera groups should be that of selective acquisition based primarily on climatic suitability, followed by other selection factors.

Section Three: Magnolia at Eastwoodhill

That with respect to the Magnolia family trees examined in the field exercise, the actions as described in Table 3.13 be undertaken.

That the development plan for the genus *Magnolia* at Eastwoodhill, as outlined in section 3.5 of this document, be adopted.

Section Four: Development plan for Pear Park

That the theme of Pear Park, as outlined in section 4.3 of this document, be ratified.

That the management strategy for Pear Park, as recommended in section 4.5 of this document, be adopted.

Section Five: Curator's forum

That the ideas outlined in discussion section 5.3 be considered in the development of the Basinhead area.

That an assessment of the plant material in Basinhead be conducted and the results thereof be used in conjunction with section 5.3 to resolve development issues for the Basinhead area.

Section Six: Conclusions

That the third workshop be held in early 1991.

That the third workshop address topics such as outlined in section six of this document.

SECTION ONE: Issues

Aim

To discuss issues relevant to the Plant Management Committee and its operation.

Issues

1. The Douglas Cook Centre for Education. The new study centre development was outlined. It was felt that the plant management committee should liaise with the group running the study centre. At the next meeting it would be valuable to discuss the herbarium aspect of the centre.
2. Public interface. To inform arboretum users of the activities of the workshop it is proposed that the curator prepare items for the next newsletter of the Friends of Eastwoodhill.

Recommendation: That the Plant Management Committee should establish liaison with the Douglas Cook Centre for Education.

SECTION TWO: Key Genera

2.1 Aim

The aim of this section was to continue the development of the key genera of the collection with the ultimate aim of devising a development plan for each genus.

2.2 Background

Initially the background information to this discussion was reviewed (Appendix Tables 2.1, 2.2). The definition of key genera was reiterated:

Key genera - the major groups of plants that form the backbone of the collection. These are the plants that give Eastwoodhill its distinct character.

The key genera assigned at the first workshop were reviewed. These were:

*Abies**, *Acer*, *Aesculus*, *Alnus*, *Betula*, *Conifers (all)*, *Fagus*, *Ilex*, *Juniperus**, *Malus*, *Magnolia*, *Picea**, *Pinus**, *Prunus*, *Pyrus*, *Quercus*, *Tilia*

* These conifer groups included individually as they are the largest groups. This was an arbitrary decision by the author when preparing the background notes, this matter has not yet been discussed by the workshop.

2.3 Discussion

The assessment results from the first workshop, and the associated ranking of genera was discussed (Appendix Tables 2.3-2.5). Assessment results for the genera at Eastwoodhill in terms of average score, number at Eastwoodhill, and weighted score were considered.

It was noted that all key genera, except *Pyrus*, achieved an average score of 8.0 or above and therefore are included in the table of ranking according to average score (Appendix Table 2.3). This table also demonstrated the relative importance of the single species and small genus groups in relation to the selected key genera. Of the top six ranks four are held by key genera, the other two are held by Magnolia group plants.

Genera were also ranked for number of species and cultivars at Eastwoodhill, in this case key genera held the top six places (Appendix Table 2.4). Genera that ranked highly in this table, but which are not key genera included, *Sorbus*, *Syringa*, *Crataegus*, *Chamaecyparis*, *Fraxinus*, and *Populus*.

Ranking for weighted score demonstrated a similar pattern to the above, with the top five placings being held by key genera (Appendix Table 2.5). Groups that appear in the top ranking but which are not key genera included *Sorbus*, *Syringa*, *Crataegus*, *Chamaecyparis*, *Fraxinus* and *Populus*.

Given this information a number of genera were debated as possible inclusions in the key genera list. The key genera as the collection stands at present were considered, as well as proposals for future key genera. Conifers were discussed separately.

Present genera - broadleaf

1. As proposed at the first workshop

Acer, Alnus, Aesculus, Betula, Ilex, Fagus, Malus, Magnolia, Prunus, Pyrus, Quercus, Tilia, are key genus groups and this status should not be changed.

2. *Crataegus*.

The number of species and cultivars of this genus present at Eastwoodhill give this group a ranking of 11th for this factor. The group was also ranked 11th for weighted score. Although the average score (7.56) is below the designated cut off point of 8.0 it was felt that the other factors merit this genus being proposed as a key genus. The problem of Pear slug was commented on, the plants will need spraying to look their best.

3. *Fraxinus*

This genus also merited consideration given the ranking of 14= for number of species and cultivars at Eastwoodhill. *Fraxinus* was ranked 13th for weighted score. The average score for this group (7.61) is also below the designated cut off point of 8.0 but Eastwoodhill seems to hold a nationally significant collection of ash (see IDS data) which should be given key genus status. The genus consistently appears in the upper portions of the analysis tables, but was not originally included in the key genus group. It is now proposed as a key genus.

4. *Populus*

Populus also appears in the upper group for weighted score, and within the first 20 places for number at Eastwoodhill. With regard to the latter the genus ranks as well as *Juniperus*, and better than *Ilex* or *Aesculus*. The average score is relatively low at 7.17. Of all the genera that consistently appear in the upper portions of the score tables this group is the lowest ranked of all. It is proposed that *Populus* becomes a key genus as regards species, particularly for the new area. Clones of species should be chosen to avoid cross pollination and seeding problems. Hybrids and cultivars should be avoided (a) because these types are comprehensively covered by the Plant Materials Centre, and (b) because there are a great number of these, while Eastwoodhill is concentrating on species.

5. *Sorbus*

Sorbus ranks 7th for weighted score, indeed it is the highest ranking non-key genus. In fact it achieves a high average score (8.5), as well as a high rank for Number (7th), in addition to the high weighted score rank. These figures would suggest that this group should be included as a key genus. However *Sorbus* is climatically unsuitable, which is easily demonstrated upon examination of the trees in question. The climate is not cool enough and most of the trees are unthrifty. Many have died out and are listed as 'not found'. *Sorbus* is not proposed as a key genus.

6. *Syringa*

Syringa ranks 9th for weighted score, with an average score relatively low at 7.12. *Syringa* was declared not suitable as a key genus as lilac cultivars are not successful here given that they need more intense cultivation than is possible at Eastwoodhill. However species lilacs were worth considering.

7. Deciduous azaleas.

Deciduous azaleas were discussed as these form an important element of the spring character of the arboretum. There are problems in growing these plants on this site, therefore plant selection must be prioritized to take this factor into account.

8. *Camellia*.

Camellia was proposed as a key genus. This genus was not included in any of the genera assessments as at one time it was considered that *Camellia* (and *Rhododendron*) did not constitute an important element of the Arboretum. Therefore no calculations had been done for the group. Recent calculations show the genus to be as follows:

$$19 \text{ species} + 199 \text{ cultivars} = 218$$

This would place *Camellia* at the top of the table for 'number at Eastwoodhill'. The genus was not surveyed for botanical and aesthetic score, so it cannot be added to those tables.

It was pointed out that the present collection of 'old' camellias at Eastwoodhill is quite important as a representation of that group of camellias and that this should be preserved. It was proposed that the Arboretum collect species camellias, including tender types from China, whilst at the same time preserving the 'old' collection. It was considered inappropriate to have 'modern' camellias at the Arboretum. Species and cultivars for the collection would have to be selected as many of the genus are not climatically suitable.

Future key genera

The following were proposed as potential future key genera:

1. *Celtis*.

Although there are only a few in the collection at present, this group may be an important elm family group to maintain a collection of given the recent arrival of Dutch elm disease in New Zealand.

2. *Lithocarpus* and *Castanopsis*.

These genera were suggested as a future key genus of warm temperate origin and as a companion group to the oaks. There are many species, but obtaining the plants may also be difficult.

3. *Nothofagus*

This genus may be important as a member of the oak group and as part of the Gondwanaland collection.

Present genera - Conifers

In the original deliberations at the first workshop it was decided that all conifers should be included as a collective key genera group because of the importance of the conifers as a whole. On investigation it transpires that there are 37 genera of conifers at Eastwoodhill, many of these are single representatives or only small groups. In order to make data handling easier only the larger groups were included in the tables for this workshop, namely *Abies*, *Picea*, *Pinus*, *Juniperus*. The conifers as a group had not been discussed by the workshop, this was subsequently undertaken (Appendix Tables 2.3-2.5).

In terms of number of species and cultivars at Eastwoodhill, and the weighted score, the following genera hold a significant position: *Abies*, *Chamaecyparis*, *Cupressus*, *Juniperus*, *Pinus*, *Picea*. There are a number of very high scoring individual examples in terms of average score, but these do not have the weight of numbers to constitute a key genus.

1. Abies and Picea

These two groups rank well in terms of weighted score and fall in the top 20 places for number at Eastwoodhill. *Abies* has an average score of 8.25 and *Picea* of 7.89. However many of these species are not climatically suitable for this site and if a policy of collecting all species is pursued then many failures will result. It was proposed that these genera be removed from the rank of key genus and that a policy of selective acquisition be followed, based on climatic suitability (dry climate range).

2. Cedrus

This is a small genus group that does not rank for any of the factors measured. However the success of the genus, and its high level of use in the structural plantings of the arboretum support the inclusion as a key genus.

3. Chamaecyparis

Although this genus is ranked quite highly for number at Eastwoodhill, and the weighted score is similar to that of *Juniperus*, the average score is low at only 6.28. *Chamaecyparis* is not proposed as a key genus.

4. Cupressus

This genus is proposed as a key genus because of its good climatic suitability. The ranking for Number is 27=, similar to *Fagus* and *Tilia*. The weighted score is also low, being near the lower cut off point, the average score is also low at 6.78. However the climatic suitability of the group, and therefore the potential success of the group at the arboretum outweighs the previous factors and includes this group in the proposal for key genus status.

5. Juniperus

Juniperus is proposed as a key genus because of its climatic suitability for the site. With an average score of 7.11 this genus does not appear in the ranking for average score. Its position for weighted score and number are 15th and 14th respectively. Therefore in terms of ranking this genus holds a middle range position. The climatic suitability outweighs this though, as does the significance of the collection already held at Eastwoodhill when compared with national results.

6. Pinus

Pinus is also proposed as a key genus because of its climatic suitability. This genus is the highest ranking conifer group in terms of weighted score and for number of species and cultivars at Eastwoodhill. At an average score of 8.39 it is the highest ranking major conifer group for this parameter.

Future key genera - conifers

Keteleeria and *Taiwania* were proposed due to the large number of warmer temperate examples of these groups that could be grown at Eastwoodhill. *Callitris* is proposed for climatic suitability. *Podocarpus* is proposed for the Gondwanaland collection. *Athrotaxis* and the Taxodiaceae group are proposed as an important group of Chinese and/or warm temperate flora.

Collection policy for key genera

After some discussion it was agreed that acquisition of plants in the key genera groups should follow the following policy:

1. The emphasis should be on species of the key genera groups. All species available should be attempted, either grow a live specimen, or if the species is not successful then keep a herbarium specimen.
2. If the genus is not a key genus then acquisition should be selective.

Issues

1. Criteria for key genera should be considered.
2. Objectives in relation to the expansion of key genera should be developed.
3. Conifer groups need to be examined and suitable species preselected.

Recommendations:

That *Camellia*, *Crataegus*, *Fraxinus* and *Populus* (*species only*), be added to the list of key genera and *Cedrus*, *Cupressus*, *Juniperus* and *Pinus* be the key conifer group

That the redefined key genera list (present) now includes:

Acer, *Aesculus*, *Alnus*, *Betula*, *Camellia*, *Cedrus*, *Crataegus*, *Cupressus*, *Fagus*, *Fraxinus*, *Ilex*, *Juniperus*, *Malus*, *Magnolia*, *Pinus*, *Populus* (*species only*), *Prunus*, *Pyrus*, *Quercus*, *Tilia*

That *Celtis* (and *Ulmaceae*), *Theaceae*, *Magnoliaceae*, *Callitris*, *Keteleeria*, *Podocarpus*, *Taiwania*, and *Taxodiaceae* be considered as potential future key genera groups.

That the acquisition policy for key genera groups should, in the absence of a specific genus plan, be the acquisition of all types where possible. If a species does not succeed at Eastwoodhill then an herbarium sample should be held.

That the acquisition policy for non key genera groups should be that of selective acquisition based primarily on climatic suitability, followed by other selection factors.

SECTION THREE: Development of the collection - Magnolia

3.1 Aim

To consider in detail the status of the genus *Magnolia* at Eastwoodhill and formulate a development plan for that genus within the collection.

3.2 Background information and field exercise

The background information for this exercise was considered (Appendix Tables 3.1- 3.3). The current Eastwoodhill collection contains 61 species and cultivars of *Magnolia*, and 12 other species and cultivars of other members of the Magnolia family. This represents about 3% of the total species and cultivars at the arboretum. *Magnolia* was one of the most important genera in the Arboretum assessment, given the highest average score, and being placed highly for weighted score (4th) and for number (5th). *Talauma* and *Manglietia* both ranked highly for average score and are highlighted as single example high scoring plants.

In addition to the above Cook also purchased another 37 species and cultivars that are no longer in the collection (Appendix Table 3.2).

As a representation of the genus Eastwoodhill holds about 50% of *Liriodendron* species, about 40% of *Magnolia* species, and less than 6% of any of the other family members (Appendix Table 3.3).

The assessment results for this group were then considered (Appendix Tables 3.9-3.11). The plants assessed as being the most botanically important included a mixture of *Magnolia* and Magnolia family plants. *Manglietia*, *Michelia*, *Talauma* and *Schisandra* all occurred above the cut off of 8.0 for average score. It is notable that most of the species ranking as botanically very important are represented by only one or two specimens at Eastwoodhill. The plants assessed as being the most aesthetically important produced a different list. Notably types of *Magnolia campbellii* were considered the most important. Species that rank highly in both lists include *M.campbellii* types, *M.sargentiana* var. *robusta*, *M.sprengeri* var. *diva*, *M. dawsoniana*, *Michelia doltsopa*, *Manglietia* sp., *Talauma* sp. (Appendix Tables 3.9, 3.10).

Given the preliminary assessment of the importance of various species a field exercise was then undertaken to assess the quality of the actual plants on site. Species for consideration were those that ranked highly in one or both of the botanical and aesthetic assessments. In the field exercise individual examples were rated for health, and as an example of the species. Rating scales can be found in Appendix Three.

3.3 Results

Table 3.12 Preliminary and field assessment of selected Magnolia family plants

Species	Reference number	Botanical score	Aesthetic score	Status at Eastwoodhill	Health score	Example of species score
<i>Magnolia officinalis</i> var. <i>biloba</i> (Barn)	Ga940	8.0	7.2	1/2	8.2	7.8
<i>Michelia doltsopa</i> (Barn)	Gal002	8.2	9.2	1/3	5.8	5.0
<i>Magnolia veitchii</i> 'Peter Veitch'	Ga860	5.0	7.7	1	5.8	5.8
<i>Michelia doltsopa</i> (Black Gate)	DP155	8.2	9.2	2/3	6.6	6.2
<i>Magnolia dawsoniana</i> (upper)	OH538	8.4	9.0	1	7.8	8.4
<i>Magnolia sprengeri</i> var. <i>diva</i>	OH550	8.8	9.8	1	7.4	5.4
<i>Magnolia sargentiana</i> var. <i>robusta</i>	OH568	8.6	9.8	1	7.0	6.4
<i>Magnolia kobus</i> var. <i>borealis</i>	OH544	6.0	7.0	1/many	9.0	8.6
<i>Magnolia veitchii</i>	OH652	5.8	7.8	1/3	8.2	6.4
<i>Michelia compressa</i>	DP66	8.6	6.0	1	8.8	8.2
<i>Magnolia grandiflora</i> 'Goliath'	DP148	6.4	8.4	1	8.6	7.0
<i>Magnolia macrophylla</i>	DP156	8.4	8.4	1/3	8.4	6.6
<i>Magnolia macrophylla</i>	DP157	8.4	8.4	2/3	8.2	8.2
<i>Magnolia officinalis</i> var. <i>biloba</i>	DP158	8.0	7.2	2/2	5.8	5.4
<i>Magnolia campbellii</i> (Birch Hill Pond)	DP77	8.2	9.8	1/3	7.2	6.8
<i>Magnolia campbellii</i> (Cook's Corner)	CC5	8.2	9.8	2/3	6.2	5.6
<i>Magnolia cylindrica</i> (Cook's Corner)	CC7	8.2	7.8	1/2	3.4	3.6
<i>Magnolia</i> 'Douglas Cook'	CC4	6.0	8.0	1/7	7.6	8.0
<i>Talauma hodgsonii</i>	CaP	8.8	8.4	1	8.0	6.6
<i>Magnolia campbellii</i> (Cabin)	CaP	8.2	9.8	3/3	7.0	6.4
<i>Manglietia</i> sp.	CaP	9.0	8.4	1	8.6	7.2
<i>Magnolia delavayi</i> (Cedar Garden)	CaP	7.0	7.6	1/3	9.2	8.8
<i>Liriodendron tulipifera</i> 'Variegata'	CaP	6.4	7.8	1/2	8.8	9.4
<i>Schisandra</i> sp.	CaP95	8.6	6.8	1	9.0	8.4

Notes

1. Plants on this list scored 7.5 or over for either botanical or aesthetic score.
2. Plants are listed in the order visited.
3. All assessment scores are expressed as a mark out of ten.
4. Status at Eastwoodhill indicates the number of that species, e.g. 1/3 indicates one specimen out of three. 3/3 indicates the third specimen out of three.

Table 3.13 Magnolia field exercise - Recommendations

Magnolia officinalis var. biloba. This tree poses no problems, all scores are satisfactory.

Michelia doltsopa (Barn). Action required. This tree is a reversion from the Caerhays form. It is quite one sided due to crowding on the inside, it is also double leadered. Assessments for health and example of species were both unsatisfactory. As this species is easily available it should be repeated on a better site. There are better forms available that should be obtained, for example 'Silver Cloud'.

Magnolia veitchii 'Peter Veitch' Action required. This plant is on a very hard site. Neither field ratings are satisfactory. It should be propagated and repeated. The species is available commercially.

Michelia doltsopa (Black Gate). Although this tree achieved field scores above the critical level of 6 it has some problems. It seems to have borer and it has lost its leader. It is on shallow soil and has been overshadowed (latterly overhanging branches have been removed). The identity is uncertain, the underside is rather rusty, but not enough for 'Rusty', it may be a D&D form.

Magnolia dawsoniana (upper OH). All ratings satisfactory. This species has been repeated elsewhere.

Magnolia sprengeri var. diva. This tree is showing vigorous sucker growth indicating it has regrowth potential. But it is badly overshadowed. It is not an adequate example of the species but it will make healthy growth if suitably released and will improve over time. This species has been repeated elsewhere.

Magnolia sargentiana var. robusta This particular specimen should be propagated. The overhanging oak branches should be removed

Magnolia kobus var. borealis This particular specimen should be propagated as it is a good form.

Magnolia veitchii (inside OH gate). This tree has poor form and is small for its age. It is making some strong growth. This species seems to be particularly susceptible to possums.

Michelia compressa A healthy tree that is a good example of the type. Remove competing branches from nearby trees. This species has been repeated elsewhere.

Magnolia grandiflora 'Goliath' A healthy tree that is being crowded. Remove competing branches from nearby trees. Remove nearby cherry.

Magnolia macrophylla (cluster). A cluster of stems that is the remnants of heeled in trees. Healthy and a reasonable example.

Magnolia macrophylla Good example in all respects.

....continued

Magnolia officinalis* var. *biloba (Rock Point Pond). Urgent action required. A poor example that is not healthy. Some trunk sprouts are occurring indicating growth difficulties, dieback of the crown supports this assertion. There are many trees in the vicinity although the crown itself is not crowded. This species has already been repeated on Orchard Hill.

Magnolia campbellii (Birch Hill Pond). This plant is a mixture of *M.campbellii* and *M.campbellii* f. *alba*. It is satisfactory for health and as an example of the species.

Magnolia campbellii (Cook's Corner). Action required. This tree is a poor example and is marginal for health. Although it is on a very windy site this plant flowers satisfactorily, it should be protected from wind. This would improve its capacity as an example of the species.

Magnolia cylindrica Urgent action required. This is a very unhealthy plant as the health score of 3.4 indicates, consequently it is also a poor example of the species. This species has already been resited elsewhere.

***Magnolia* 'Douglas Cook'** Satisfactory.

Talauma hodgsonii. Although healthy and a reasonable example, this tree is very small for its age, it has been severely suppressed. The adjacent cherry should be removed to remove competition.

Magnolia campbellii (Cabin). This plant is healthy enough but very crowded. This plant exhibits particularly good flower colour. It should be propagated.

***Manglietia* sp.** The identity of this tree is uncertain. It is a healthy specimen and a good example. It is producing some strong growth as a result of being released from competition the season before.

Magnolia delavayi A very good specimen in spite of its position in shade and associated heavily with other trees.

***Liriodendron tulipifera* 'Variegata'** Satisfactory.

***Schisandra* sp.** This vine has recently been cut back and reinstalled on a climbing frame after the tree it was on collapsed. It is making strong growth and is a satisfactory example.

3.4 Discussion - field exercise

After completing the field exercise the results were considered and discussed. The most common problem found with the specimens examined was overcrowding, almost all examples had this problem. The overcrowding problem can be reduced in many cases by removing overhanging branches or nearby trees of less value. The form of many specimens could be improved by judicious branch removal.

Many problems can also be explained by the effects of poor siting. Age of the trees is also a factor contributing to poor ratings. However the effects of release can be seen in the amount of regrowth on some of the trees. It was concluded that the Cook's Corner site is quite unsatisfactory for *Magnolia*, wind being the critical factor.

Health

With regard to the health rating it was decided that a score of 3(6) was the critical level for action. A score of 3(6) needs action, a score of 2(4) needs urgent action. Scores of 4(8) and 5(10) were satisfactory. (Scores are expressed on a 1-5 scale, then in brackets the equivalent on a 1-10 scale).

This meant that *Magnolia cylindrica* and *Magnolia officinalis* var. *biloba* (2nd example) needed urgent action. In both cases this has already been carried out with these species having been replanted elsewhere. A health rating of 3 also was of concern, *M.campbellii* (Cook's Corner), *Michelia doltsopa*, *M. veitchii* 'Peter Veitch'.

Example of species

Once again 3(6) seems to be the critical level on the scale as an example of the species, anything below this level is not acceptable as an example of the species. Of the examples viewed *Michelia doltsopa* (Barn), *Magnolia* Peter Veitch, *Magnolia sprengeri* var. *diva*, *Magnolia officinalis* var. *biloba* (Rock Point Pond), *Magnolia campbellii* (Cook's Corner), *Magnolia cylindrica* were not considered good examples of the species. Levels 4(8) and 5(10) are acceptable.

The fact that the trees have come this far under difficult conditions is a good test of the trees. *Magnolia* have tremendous powers of recovery. Opinion varied on the number of trees viewed that were in fact good examples. The range was between 30-60% good examples, down to only 6 trees.

Recommendation: That with respect to the Magnolia family trees examined in the field exercise the actions as described in Table 3.13 be undertaken.

3.5 Development plan for the Magnolia group at Eastwoodhill

Many aspects relating to the Magnolia group at Eastwoodhill were discussed. Given the aim of this exercise the discussion will be reported as a development plan.

Recent acquisitions

The following have recently been acquired and therefore did not appear on the current list.

Magnolia brooklynensis 'Woodsman'

Magnolia 'Caerhays Belle'

Magnolia denudata 'Forrests Pink'

Magnolia dawsoniana 'Chyverton Red'

Magnolia grandiflora 'Little Gem'

Magnolia 'Norman Gould'

Magnolia sargentiana

Magnolia sprengeri var. *diva* 'Diva'

The current collection

The policy for the current collection should follow these guidelines:

- 'old' cultivars should be kept for reference purposes.
- the *M. soulangiana* group particularly should be kept for reference.
- types originally imported by Cook should be retained.
- those special to Eastwoodhill should have more than one example. Namely *Magnolia dawsoniana*, *Magnolia sprengeri* var. *diva*, *M.sargentiana* var. *robusta*, *Magnolia kobus* var. *borealis*, *Magnolia campbellii* (Cabin), *Manglietia*.

Criteria for acquisition

The policy on acquisition should follow these guidelines:

- concentrate on species. Try everything. If it will not grow then keep a herbarium specimen.
- there is an obligation to hold unusual types for reference and educational purposes.

Attention should be paid to good form, climatic range, climatic adaptability, site selection.

Acquisition with respect to number

Acquisition with respect to number should follow these guidelines:

- as long as there is space and suitable sites then 2-3 of each important species should be held.
- plants imported by Cook should be represented by three examples.
- plants commercially available do not need multiple representation.
- species special to Eastwoodhill should be represented by more than one example, (*M.dawsoniana*, *M.sprengeri* var. *diva*, *M.sargentiana* var. *robusta*, *M.kobus* var. *borealis*, *M.campbellii* (Cabin), *Manglietia*).

Acquisition with respect to actual species

Of the plants highly ranked the following should be obtained:

- *Magnolia nitida*. Available, obtain from O.Blaumhardt.
- *Manglietia hookeri*. Propagate locally from Dot Gray.
- *Mangleitia insignis*. Availability unknown.
- *Magnolia officinalis*. Appears to be unobtainable.
- *Magnolia coco*. Is at Eastwoodhill and is too tender, relocate elsewhere.
- *Magnolia hypoleuca*. Available, obtain.
- *Magnolia virginiana* 'Autumn Delight'. Available, obtain.

Others to obtain:

- *Magnolia globosa*. Already acquired ex Pukeiti.
- *Magnolia sargentiana*. Already obtained ex ?.
- *Magnolia rostrata*. Not really available and very difficult to propagate.
- *Magnolia watsonii*. Very good scent. Obtain.
- *Magnolia wilsonii*. Obtain.
- *Magnolia ashei*. A good species but the flowers are small. Obtain.
- *Magnolia campbellii* f. *alba*. Obtain and put in a better position.
- *Magnolia* 'Strybing White' for Orchard Hill. Obtain.
- *Magnolia* 'Darjeeling'. Obtain.

Expansion of the group

The Magnolia group represents a significant opportunity for expansion under the general aims of the collection as stated at the first workshop, namely the theme of warm temperate flora. Given that the percentage coverage of the family at Eastwoodhill ranges from approximately 3-50% of the genera in question, there is considerable scope for expansion. Selection of this group for expansion is supported by the consistently high assessment scores achieved by this group of plants.

Such an expansion will require an investigation into suitable material and the acquisition of the same. The following matters were identified as requiring investigation in this regard:

- The genera *Manglietia*, *Paramichelia*, and *Talauma*. There are many species here, some of which may be suitable for Eastwoodhill.
- species that are climatically suitable.
- further information on what is available in New Zealand. *Manglietia* and *Talauma*. (Contact O. Blaumhardt.)
- further information on *Michelia* and *Paramichelia* (contact Ron Gordon).
- inclusion of *Illicium* in the group.
- investigate the Chinese connection, liaise with Ron Gordon and Pukeiti Rhododendron Trust.

Recommendation: That the development plan for the genus *Magnolia* at Eastwoodhill, as outlined in section 3.5 of this document, be adopted.

SECTION FOUR: Management of the collection - Development plan for Pear Park**4.1 Aim**

The aim of this exercise was to formulate a strategy for managing the park over time, a plan for propagation, planting and removal. Given the aim of this exercise the results shall be presented as a development plan.

4.2 Description

Pear Park is in the lower portion of the Arboretum, in the south east corner. The site is basically flat with a gentle slope towards The Ride. Pear Park is important because of its position in the Arboretum as a whole, i.e. it is close to the carpark, and because it has sheltered open spaces. The park has difficult soil which is shallow and poorly drained. There are drains through the park across Linden Green although recent winters have not been wet enough for these to run.

Planting in Pear Park began in 1920 with pin oaks, elms, and english ash. In 1949 the Linden Green circular track was installed and the main body of the park planted. In the 1950s trees were lined out in what is now Nursery Wood. In the 1960s eucalyptus were removed. *Carya ovata*, *Taiwania cryptomerioides*, and *Acer saccharum* 'Arnold form' were planted in the late 1960s.

The park now contains plantings of many deciduous trees; oaks, maples, crataegus, tilia, ash and platanus are well represented. There is a significant collection of junipers in the lower part of the park. The pin oaks planted in 1920 are some of the biggest trees in the park at about 30m tall.

Plants currently in the park are illustrated by the park plans, sheets 6-9 of the arboretum set. {The reader of this thesis should refer to plans 2 and 3 in thesis Appendix Two.} Plants that have been in the park but which are no longer present are outlined in Appendix Table 4.3.

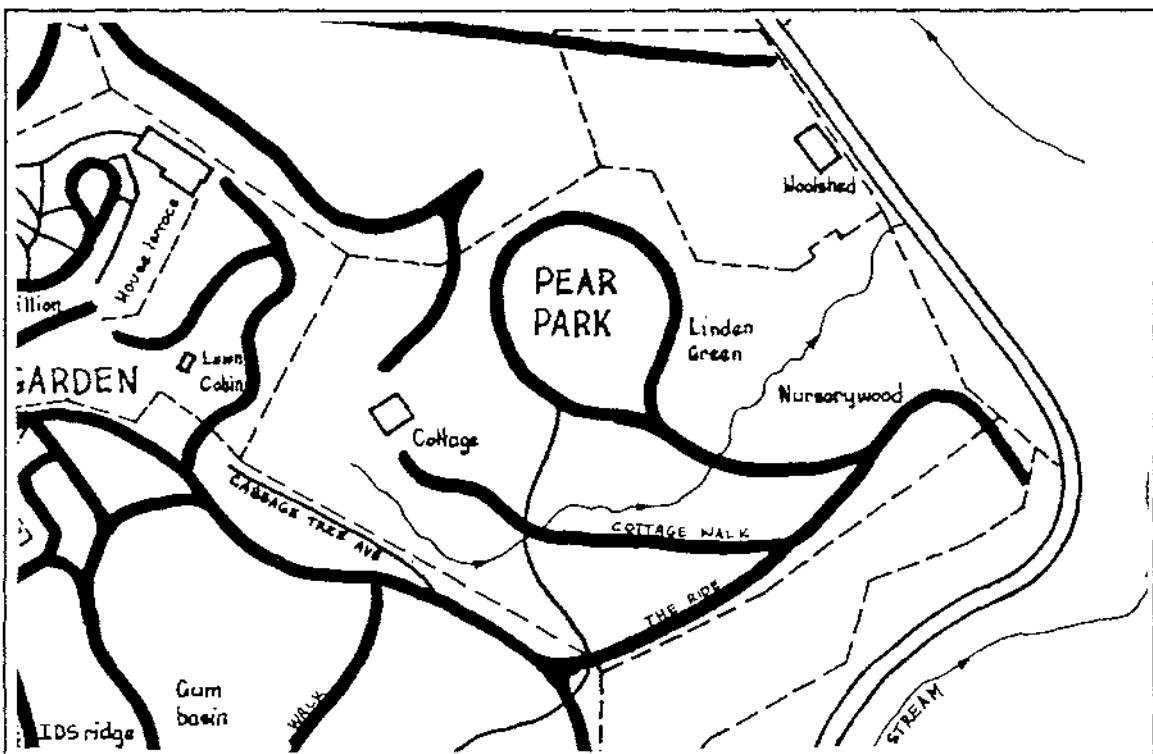

Many of the plantings in Pear Park are crowded and many are reaching the end of their useful life. At the same time other trees are in excellent condition and will continue to be so for many years. Given these problems it is necessary to formulate a management strategy to address these issues.

4.3 Theme

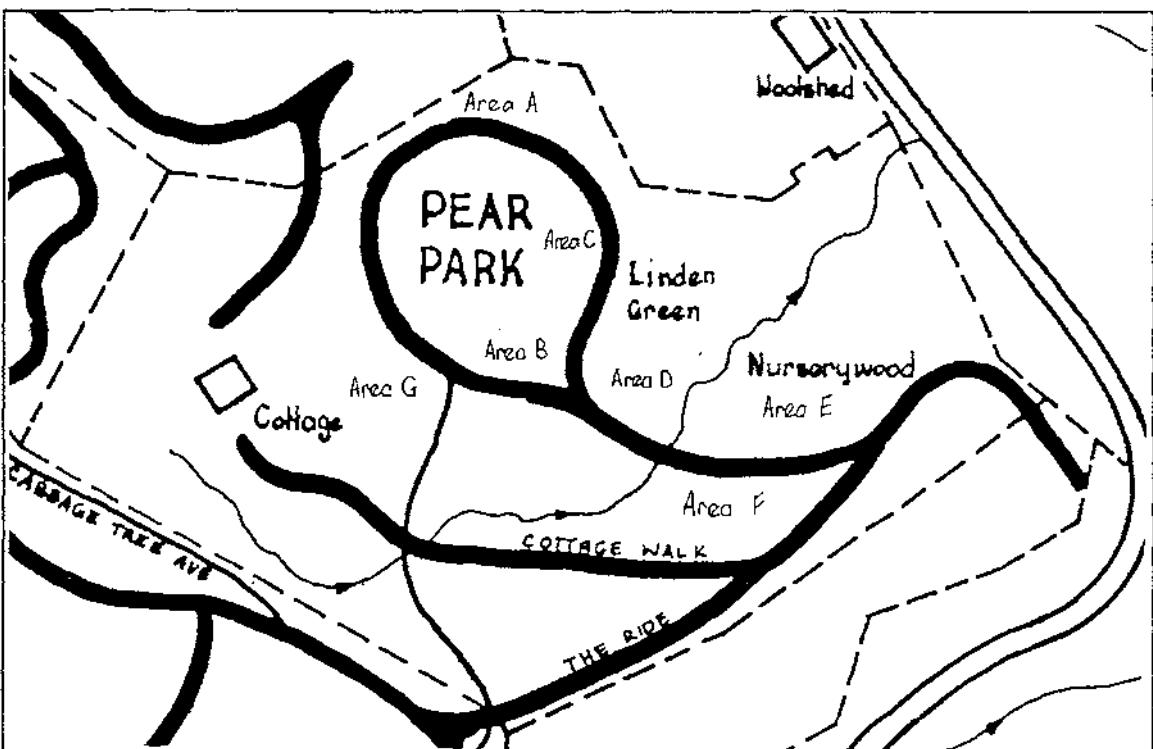

At the first workshop it was resolved that 'The theme of the Arboretum was that of temperate and warm temperate flora, focussing on the key genera plant groups that have already been identified.' (Key genera as outlined in first workshop report.). At the same workshop it was resolved that the role of the arboretum is 'To maintain and further the collection of Douglas Cook.'

With respect to Pear Park it was agreed that the park should continue to reflect the views and objectives of Douglas Cook. The management plan should maintain and conserve these objectives. The following were identified as the themes of Pear Park:

1. The general absence of conifers. Bill Sykes reports that it is his understanding that Douglas Cook purposely excluded conifers.
2. There is a strong rose family influence. This is demonstrated by the *Malus*, *Crataegus*, *Crataegus* hybrids, *Prunus*. Examination of the previous plants list supports this point.

Segment of the arboretum plan showing the location of Pear Park.

Plan of Pear Park showing location of areas A-G referred to in the results. Plans are found in thesis Appendix Two.

3. There is a distinct deciduous character to Pear Park. There are some evergreens, (oaks and camellias), but the majority is deciduous. Ron Gordon reports that Cook stressed to him that this park would be deciduous and that it would be a feeding ground for flora and fauna, hence the large number of fruit plants.
4. Fruiting plants. This theme is supported by the evidence in point three.
5. Following of a species composition such as outlined by Appendix Tables 4.1,4.2.
6. The central open space is a key feature.

4.4 Park evaluation - method

To evaluate the park the following procedure was followed:

1. Consideration of the current composition of the park and other background information.
2. Definition of permanent and transitory elements
3. Field exercise

Background information

The distribution of arboretum key genera in Pear Park was examined (Appendix Table 4.1). It was noted that of the key genera Pear Park contains a significant portion of *Aesculus*, *Fagus*, *Juniperus*, *Malus*, *Quercus*, and *Tilia*.

The distribution of other genera in Pear Park was examined. Significant groups in Pear Park are *Celtis*, *Emmenopterys*, *Gleditsia*, *Platanus*, *Platycarya*, *Buddleia*, *Stuartia*, *Viburnum* (Appendix Table 4.2). Some of these are single genus high scoring plants, for example *Emmenopterys*; others are significant representation of smaller genera in the arboretum, for example, 42% of the *Celtis* are in Pear Park, including sole examples.

Assessment of the plants in Pear Park for botanical and aesthetic value can be found in Appendix Tables 4.6 and 4.7.

Permanent and transitory elements

Permanent elements are described as those that, when in an acceptable situation, are sufficiently long lived as to be considered permanent. Transitory elements are described as those that are not long lived and will require regular replacement in relation to the permanent elements.

The definition of elements in this way allows the manager to distinguish those that will need regular attention and replacement from those that will not need such replacement. It is desirable that the framework of the park be formed from permanent elements, thus the framework of the park is always retained and is not disturbed by the need to recycle short lived material. The definition of the genera in this way does not necessarily mean that any will be removed from the park, it simply means that the transitional (shorter lived) groups will need more intensive management to keep them at their best at all times.

The permanent elements (longer lived) of Pear Park have been agreed to be:

- *Acer*, *Aesculus*, *Camellia*, *Celtis*, *Cryptomeria*.
- *Fraxinus*. This genus, when in an acceptable situation, would be a permanent element. However at present these trees are not thrifty due to being grafted onto *F.exelsior* stock. If grafted onto more appropriate stock then there will be no problem with the length of life of this group.

● *Juniperus*. This genus, when growing in an acceptable situation, would be a permanent element as it is long lived. However the current site is quite unsuitable as it is too wet and shady. This fact, plus the deciduous theme of Pear Park lead to the conclusion that this grouping should be relocated.

● *Platanus, Quercus, Sequoia, Tilia, Ulmus*.

Transitional (shorter lived) species of Pear Park are:

● *Betula, Buddleia, Euonymus, Crataegus* and hybrids, *Cotoneaster, Malus, Philadelphus, Prunus*.

Field exercise

A field exercise was conducted that made detailed examination of the trees within the park. This was done in two stages. In the first stage the Linden Green area was examined and trees rated for health, growth phase, and as an example of the species. (Rating scales can be found in Appendix Three). Analysis of these indicators will form a basis for decision making on individual trees. In the second stage the rest of the park was examined and a series of recommendations made.

4.5 Park evaluation -results

Results for the examination of Pear Park can be seen in Table 4.5 which shows the ratings for the Linden Green section, by Table 4.8, and by plan pages A-G, which should be referred to concurrently. {In the original version of this report plans A-G followed here. Plans of Pear Park can be found in thesis Appendix Two. The location of areas A-G is shown on page 651.}

For the field ratings it was agreed that for health and example of species a score of 3,2, or 1, required some action. Levels 4 and 5 were satisfactory. For the growth phase rating a score of 1 required some action. Field ratings have been summed and the action category for each plant indicated. Field scores are converted to a mark out of 10 for analysis. Using the levels just indicated the total scores were treated as follows:

- (i) total score less than 14 - urgent action required.
- (ii) total score 14 to 18 - action required in 0-5 years.
- (iii) total score 19 to 23 - okay, no immediate action required .
- (iv) total score 24 or more - tree excellent, no action required.

Table 4.5: Results sheet Pear Park exercise

Plant	Ref. number	Preliminary assessment		Field assessment			Field status and action category
		Botanical score	Aesthetic score	Health	Example of species	Growth phase	
<i>Fraxinus pensylvanica</i> 'Variegata'	PP185	6.0	7.0	4.0	6.0	4.0	14.0 action
<i>Fraxinus angustifolia</i> ssp. <i>oxycarpa</i>	PP184	-	-	8.0	8.0	4.0	20.0 okay

Table 4.8: Results Pear Park exercise - Recommendations

If a plant is not mentioned specifically in the recommendations then no immediate action is required.

The Ashes see area A.

Recommendations - urgent.

1. *Fraxinus chinensis* forms should be propagated urgently (PP171, PP179).
2. *Malus eleyi* needs urgent propagation and replanting (PP162,3).

Recommendations 0-5 years.

1. *Fraxinus pensylvanica* 'Variegata' has been repropagated and should be removed once a new plant is established (PP185).
2. *Fraxinus holotricha*, propagate as it is in declining growth phase (PP183).
3. *Fraxinus chinensis* has already been grafted onto its own seedlings. Once a new plant is established the present plant should be removed (PP177).
4. *Fraxinus pensylvanica* 'Aucubifolia', (PP158) remove as it is in poor health and is in declining growth phase. The adjacent one (PP157) is a better representative.
5. *Crataegus coccinoides* has been repropagated and should be replanted as soon as good stock is available (PP155).
6. *Crataegus jackii* and *C.jonesiae* have been repropagated and will be removed once new plants are established (PP156, PP153). The soil is very poor on this site so replanting should be elsewhere.
7. *Malus* could be replanted where trees from point 4 are removed, given selection of suitable root stock.
8. The dying side limb on *Fraxinus* (PP161) should be removed as it has been ringbarked by Puriri moth.
9. *Crataegus wilsoni* (PP166) and *C.monogyna* 'Praecox' (PP167) are very crowded and should be relocated to better sites. Both have been propagated.
10. *Crataegus crus-galli* 'Pyracanthifolia' (PP165), *C.persistens* (PP168), and *Crataegus* PP164, can remain if tidied up.

Recommendations 5-10 years.

1. *Betula jacquemontii* hybrid (PP139) should be left until it starts to impinge on the *Carya* (PP140), the birch should then be removed.

Comments

1. The site is quite suitable for ash, *F.excelsior* 'Monophylla' and *F.udhei* are particularly good. The collection as a whole needs more room, but others should be established first. When grafted onto the correct stock this group of trees will improve in health.
2. *Crataegus*. These as a group are not healthy. The group should be identified from an accurate source such as the Arnold Arboretum, Boston, as many of the Hillier names are suspect. All *Crataegus* have been repropagated by P Pollock. *Crataegus* need resiting into sunny positions.

.....continued

3. *Quercus glauca* is regrowing quite adequately after being released from a crowding ash branch.
4. *Malus* have been propagated by Ivan Mitchell.

Lime Corner see area B.

Recommendations - 0-5 years.

1. The *Quercus robur* (PP131) should be removed to allow the limes more room.
2. *Tilia platyphyllo* 'Laciniata' (PP132) should be propagated.
3. *Quercus garryana* (PP52) is in poor health, some action is needed.

Tilia mongolica* to *Quercus variabilis see area C.

Recommendations - urgent.

1. *Pyrus (Sorbus) alnifolia* (PP120), urgent propagation.
2. *Quercus acutissima* ssp. *chenii* (PP142), urgent propagation.
3. *Crataegus x grigonensis* (PP145), urgent propagate and relocation.

Recommendations 0-5 years.

1. *Aesculus glabra* (PP117) should be repropagated and relocated.
2. *Crataegus* hybrids (PP143, PP144), have been propagated, relocate further out once new stock is available.
3. Repropagated *Crataegus* should be resited on the opposite side of the Green where it is sunny, or along the sunny side of the lower part of the Green.
4. Actions as per last workshop report should be continued, i.e.,

Acer opalus (PP129), propagate and remove.

Cunninghamia konishii (PP130), propagate and remove, bring in new stock.

Acer pseudoplatanus 'Worleei' (PP127), remove.

Acer platanoides 'Reitenbachii' (PP126), check ID and propagate if necessary, obtain from new source and replant.

Acer velutinum var. *vanvolxemi* (PP123), remove.

Cunninghamia lanceolata (PP 124), remove.

Platanus acerifolia 'Cantabrigensis' (PP125), propagate.

Lower Linden Green across to *Gleditsia japonica* see area D.

Recommendations 0-5 years.

1. Selectively remove seedling ashes in lower corner, (PP245,246,247,248,249,298) then reassess next year. This will allow a view into the variegated elm foliage behind.
2. The smooth trunk evergreen oak should be removed. The knobbly trunked one should be retained and identified (PP 250 and adjacent tree).
3. Remove *Malus* 'Jack Humm' (PP111) to allow the development of a path through here for access to the lower park. This plant has been repropagated.continued

4. Relocate *Malus sublobata* (PP69) further out to give more room. This plant has been repropagated.
5. A new plant of *Tsuga canadensis* (PP68) should be obtained and planted elsewhere.
6. Replacement *Malus* should be planted in this area to keep the character.
7. Plant another *Malus hupehensis* in the gap indicated to complete the enclosure. ?????
8. Use the area below the liquidambers to replant *Malus* and/or *Crataegus*.
9. *Crataegus* stock (PP48, labelled submollis) in front of oaks to be removed to allow view into oaks.

Comments

The view into the wall of greenery behind *Malus baccata* var. *microcarpa* is very good and should be enhanced. The *Malus* along this stretch are not in good health and need to be moved further out. Chris Ryan (Toptrees, Clive), is repropagating the apples from around nursery wood. It was felt to be most important to retain the feeling of space, so any planting should not encroach on the Green too much.

Nursery Wood and the junipers see area E.

Recommendations - urgent.

1. Repropagate all Junipers and relocate in a warmer drier site. Eventually remove existing trees as they decline. Leave in the meantime while they are still healthy.

Recommendations 0-5 years.

1. Side prune the *Castanea sativa* (PP75).
2. Open up the Nursery Wood area. but at the same time conserve the tunnel effect, remove dead and dying material, remove quince. *Parrotia persica* (PP94) at the end should be the focal point.
3. Relocate apples, PP243 and PP244 elsewhere, this site is too overcrowded for them anyway.
4. Remove *Prunus cerasifera* 'Atropurpurea' (PP95) and *Fraxinus excelsior* (PP97) in lower corner to give more room to higher value trees.
5. Remove second leader from *Tilia petiolaris* (PP105).

Comments

The idea of retaining the nursery lines is fine, but natural attrition means that plants are dying out and many of the smaller trees are unthrifty. It is possible to conserve the tunnel effect while at the same time removing some material and improving the look of the area.

Cottage Course see area F.

Recommendations - urgent.

1. *Fraxinus xanthoxyloides* (PP23), urgent propagate.
2. *Pyrus (Sorbus) folgneri* (PP21), urgent propagate.

Recommendations 0-5 years.

1. Remove poor examples of *Fraxinus excelsior* along the Ride.

.....continued

2. *Crataegus* under evergreen oaks to be removed as soon as new plants are established (PP44, PP45, PP241).

Below the cottage see area G.

Recommendations - urgent.

1. *Acer diabolicum f. purpureascens* (PP189), urgent propagation.
2. *Osmanthus suavis* (PP188), urgent propagation.

Recommendations 0-5 years.

1. Relocate *Chionanthus* (PP190) into the sun.
2. Propagate *Buddleia* and *Euonymus* for replanting as the current specimens decline.
3. Relocate trees from under lower pin oak,
Acer laetum 'Aureum' (PP201), *Acer laetum 'Purpureum'*, (PP200).
Euonymus salicifolia grandiflora, (PP198), *Euonymus* PP199, PP199A.

General

Recommendations 10-20 years.

1. All ash should be propagated and prepared for replanting to replace existing trees as they decline.

Recommendations 20-30 years.

1. Repropagate all *Crataegus* and *Malus* to start next replacement cycle.

4.6 Discussion

The results as shown above outline the status of the trees examined and the level of action required. For those needing action the actual outcome will be tempered by the ascribed botanical and aesthetic importance, and the availability of that species.

Recommendations:

That the theme of Pear Park, as outlined in section 4.3 of this document, be ratified.

That the management strategy as recommended in section 4.5 of this document be adopted.

SECTION FIVE: Curator's Forum

5.1 Aim

In this section an item for discussion was introduced. This relates to an area of the Arboretum that poses a current problem for the curator and which requires some group input. The item for discussion this year is the area at the top of Douglas Park known as Basinhead. For plan and plant list refer to page 661 and Table 5.1.

5.2 Background

This portion of Douglas Park is on the main thoroughfare through Douglas Park when on the Douglas Cook Walk. Physically the area is a small basin with a flat centre surrounded by small ridges, open at the south western end. The area contains mostly deciduous trees with some evergreens. A collection of lilacs was a notable feature of the area. The plantings are set around the perimeter of what was, prior to 1985, a small pond. In 1985 a severe rainstorm set in motion a deep slip on the farmland above the park which covered the Basinhead area in 1-2m of clay, the pond was completely filled in and several trees surrounded by slip debris. A number of trees died and others were buried as a result of the slip. This, and the loss of the pond have reduced the visual appeal of the park and some improvement is required.

Important features of this area were identified by the group.

1. An important physical feature was the ridge on the western side that separates Basinhead from the adjacent area. This is an open slope with scattered *Eucalyptus leucoxylon* 'Rosea'. This piece of ground was considered very visually appealing and should be enhanced.
2. A example of *Pinus durangensis* at the lower end of Basinhead is an important specimen tree. Equally the specimen of *Populus deltoides* 'Carolin' at the upper end of Basinhead is an important example.
3. Other plantings of note include a fine white trunked birch, (species unknown), several blue atlas cedar, *Acer macrophyllum*, and a bunya pine which is recovering from top loss. A series of poplars, (identity not confirmed), run along the fence line at the back of Basinhead.
4. A number of more transitory elements are included in the planting. There are some *Prunus*, (plums peaches and cherries), and a selection of lilacs.

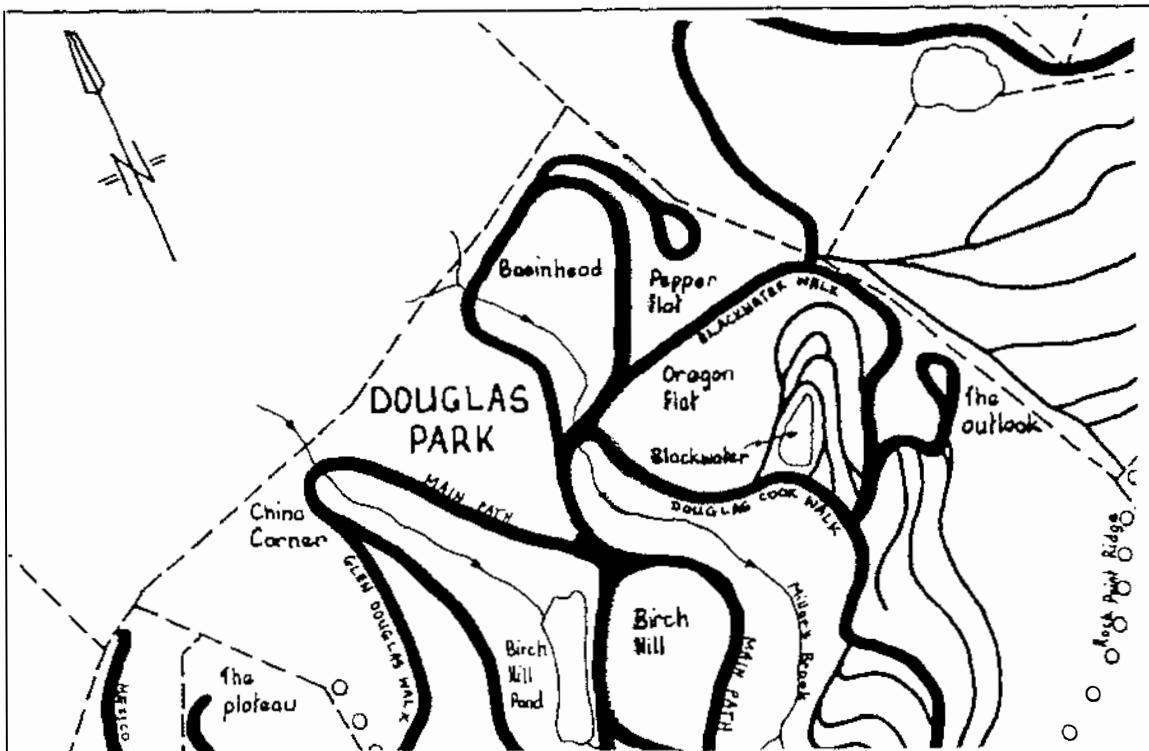

5.3 Discussion

With respect to the sloping ridge with the *Eucalyptus* the following ideas were put forward:

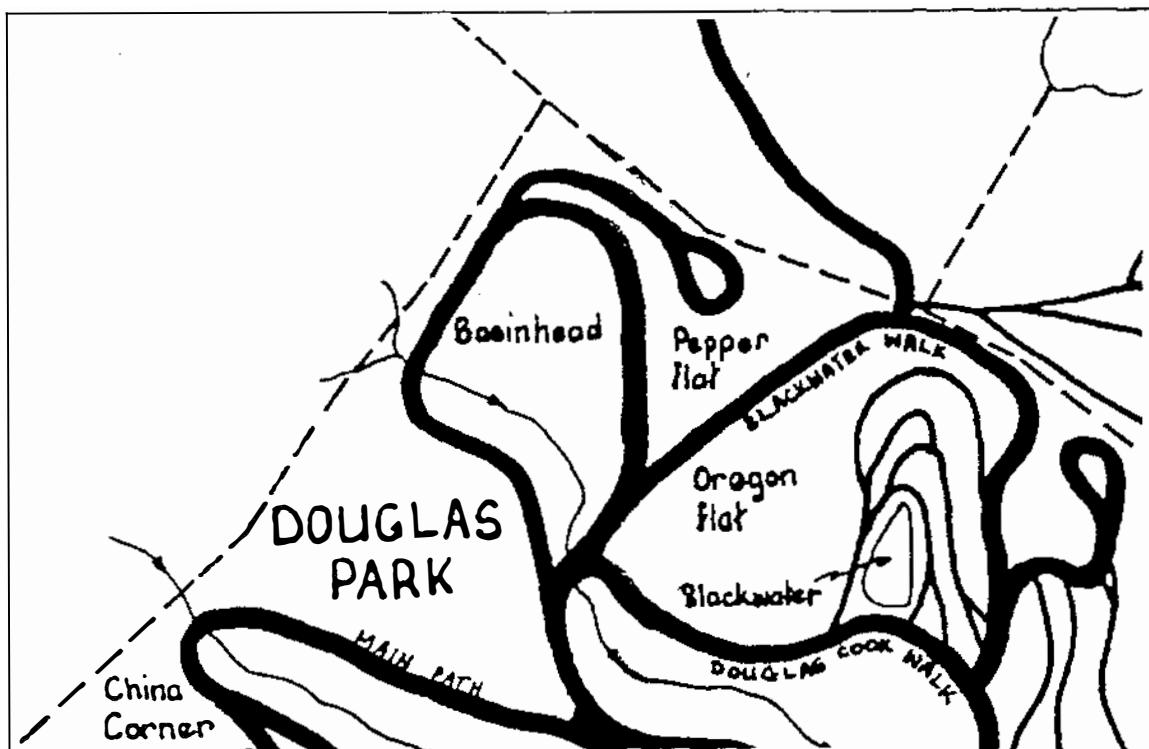

- leave the area alone but remove the poorer trees.
- underplant with shrubby material.
- install a low planting across the lower slope, and remove the poorer trees.
- enhance the ridge top by selectively pruning up the douglas fir, thereby emphasising the smooth ridge top.

With respect to the basin itself the following ideas were put forward:

- that the area is important as an open space, of which there are few in this part of the arboretum.
- the margins of the basin appear suitable for mollis azaleas, a planting of azalea about the margin of the basin would enhance the spring display.
- the central grassy area should be smoothed off.

Segment of the arboretum plan showing the location of Basinhead.

Basinhead. For detail see the plan in thesis Appendix Two.

With respect to the view through the basin to the farmland beyond the following ideas were put forward:

- that the fence line across the rear of Basinhead should be planted with small material in order to hide the fence, but allow for the view into the hillside beyond.

With respect to plant material the following ideas were put forward:

- that *Populus deltoides* 'Carolin' be pruned of broken branches, but otherwise be left as is.
- that the various flowering plum cultivars be removed, along with the dying conifers, to give a better view of the poplar.
- that the planting along the Pepper Flat side of the basin be rearranged in order to take better advantage of microclimate. At present many smaller plants are heavily overshadowed by larger plants along the side of the track, relocating the smaller plants into the edge of the basin (rather than along the track) would ensure better growth and display.
- that the yellow plum be removed.
- that the cherries along the track be repropagated.

Table 5.1 List of plants at Basinhead

<i>Abies pinsapo</i>	Fir
<i>Acer buergerianum</i>	Trident maple
<i>Acer macrophyllum</i>	Big leaf maple
<i>Acer negundo</i>	Boxelder
<i>Acer palmatum</i>	Japanese maple
<i>Araucaria bidwilli</i>	Bunya pine
<i>Betula platyphylla</i> form	Birch
<i>Betula</i> sp, white trunk	Birch
<i>Buddleia alternifolia</i>	Buddleia
<i>Cassia tomentosa</i>	Cassia
<i>Cedrus atlantica</i> f. <i>glaucia</i>	Blue atlas cedar
<i>Chamaecyparis pisifera</i> , 2 forms	
<i>Chamaecyparis squarrosa</i>	
<i>Cornus florida</i> f. <i>rubra</i>	Pink flowering dogwood
<i>Eucalyptus leucoxylon</i> 'Rosea'	Flowering gum
<i>Forsythia</i> 'Arnold Giant'	Forsythia
<i>Forsythia</i> 'Beatrix Farrand'	Forsythia
<i>Forsythia</i> 'Linwood'	Forsythia
<i>Fraxinus</i> sp.	Ash
<i>Grevillea robusta</i>	Silky oak
<i>Magnolia kobus</i>	Magnolia
<i>Magnolia loebneri</i>	Magnolia
<i>Populus deltoides</i> 'Carolin'	Poplar
<i>Populus</i> sp, 2	Poplar
<i>Prunus x bliereana</i>	Purple leaf plum

<i>Prunus cerasifera</i>	Purple leaf plum
<i>Prunus cerasifera</i> var. <i>diversifolia</i>	Yellow plum
<i>Prunus mume</i> 'Dawn'	Flowering apricot
<i>Prunus mume</i> 'Peggy Clark'	Flowering apricot
<i>Prunus mume</i> 'The Geisha'	Flowering apricot
<i>Prunus persica</i> 'Helen Borcher'	Flowering peach
<i>Prunus serrulata</i> 'Ashi Botan'	Japanese cherry
<i>Prunus serrulata</i> 'Kanzan'	Japanese cherry
<i>Prunus serrulata</i> 'Kofugen'	Japanese cherry
<i>Prunus serrulata</i> 'Yedo Zakura'	Japanese cherry
<i>Prunus serrulata</i> 'Yukon'	Japanese cherry
<i>Pyrus pashia</i>	Ornamental pear
<i>Stachyurus praecox</i>	Early spiketail
<i>Syringa vulgaris</i> 'Buffon'	Lilac
'Edith Cavell'	Lilac
'Mme Lemoine'	Lilac
'Svr de Alice Harding'	Lilac
<i>Zelkova cretica</i>	Zelkova

5.4 Conclusion

A number of useful ideas were put forward in the discussion of the Basinhead area. A botanical assessment of the plantings has not been done so no figures on the importance of the plant material are available for use in the discussion. The ideas outlined above should be used in conjunction with a plant material assessment as a basis for decision making.

Recommendations:

That the ideas outlined in discussion section 5.3 be considered in the development of the Basinhead area.

That an assessment of the plant material in Basinhead be conducted, and the results thereof be used in conjunction with discussion 5.3 to resolve development issues for the Basinhead area.

{In the original version of this report a plan of Basinhead appeared here. The reader of this thesis will find that plan in thesis Appendix Two.}

SECTION SIX: Conclusions

After some discussion the following conclusions were reached:

1. A comments box should be included on the field exercise forms.
2. The next workshop should be held early 1991.
3. The next workshop should include:
 - a section on new issues.
 - key genus examination, *Acer*.
 - a park management exercise, perhaps Corner Park.
 - an examination of a portion of the new area.

Recommendations:

That the third workshop be held in early 1991.

That the third workshop address topics such as outlined in section six of this document.

APPENDIX: Programme for the second workshop

The Second Eastwoodhill Arboretum Workshop April 1990

Programme

Friday

8.30am	Welcome and Introduction
8.45-10.00	Section One: Issues
10.30-12.00	Section Two: Key genera study Section Three: Magnolia exercise, introduction
1.00-3.30	Section Three: Magnolia exercise, field exercise
4.00-5.00	Section Three: Magnolia exercise, discussion and conclusion

Saturday

8.30-10.00	Section Four: Pear Park exercise
10.30-12.00	Section Four: Pear Park, field exercise
1.00-3.00	Section Four: Pear Park exercise, discussion and conclusion
3.30-5.00	Section Five: Bush area exercise

Sunday

8.30-10.00	Curator's forum: two issues of current concern
10.30-12.00	Workshop conclusion, discussion of new issues and priorities

APPENDIX: Tables referred to in the text.

KEY GENERA (Section Two) - TABLES REFERRED TO IN THE TEXT

Table 2.1 Key Genera, Scores assigned at the first Workshop

<i>Genus</i>	Botanical score	Aesthetic score	Average score
<i>Abies</i>	8.50	8.00	8.25
<i>Acer</i>	9.25	9.12	9.19
<i>Aesculus</i>	8.33	8.80	8.55
<i>Alnus</i>	7.00	6.14	6.60
<i>Betula</i>	8.89	8.89	8.89
<i>Fagus</i>	8.44	8.00	8.22
<i>Ilex</i>	8.44	8.00	8.22
<i>Juniperus</i>	8.00	6.22	7.11
<i>Malus</i>	8.67	8.11	8.39
<i>Magnolia</i>	9.56	9.33	9.44
<i>Picea</i>	8.22	7.56	7.89
<i>Pinus</i>	9.10	7.67	8.39
<i>Prunus</i>	9.11	9.00	9.06
<i>Pyrus</i>	7.78	6.89	7.33
<i>Quercus</i>	9.33	8.89	9.11
<i>Tilia</i>	8.67	8.00	8.33

Notes

These are the key genera as identified at the first workshop. Although conifers as a whole were targeted as key genera only the largest groups have been dealt with.

Table 2.2 Key genera attributes and ranking

<i>Key genus</i>	Number of species and cultivars at Eastwoodhill * (N)	N as a percentage of total number of species and cultivars at Eastwoodhill (%)	Average score (Av.)	Weighted score. W = % x Av	Ranked for N	Ranked for W	Ranked for Av.
<i>Abies</i>	33+4 =37	1.73	8.25	14.27	10	10	30=

<i>Pyrus</i>	6+0 =6	0.28	7.33	2.05	nr	nr	nr
<i>Quercus</i>	84+15=99	4.65	9.11	42.36	3	3	3
<i>Tilia</i>	16+1 =17	0.79	8.33	6.58	27=	22	24=

This table has been modified to include the additional genera that were assigned key genus status at this workshop. (*Camellia, Cedrus, Crataegus, Cupressus, Fraxinus, Populus*). nr = not ranked.

*species + cultivars = total

$$\text{N as a \% of the collection} = \frac{\text{Number of sp and cvr of that genus at Eastwoodhill}}{\text{Total number of sp and cvr at Eastwoodhill}} \times 100$$

Weighted score.

This score allows us to assess the collection as it is at present in terms of the contribution of a particular genus of plants to the collection. It helps us separate botanically very important genera of which there are many species and cultivars, from botanically important genera of which there are few examples. For example, compare *Acer* with *Trochodendron*. *Acer* scores highly botanically and there are many species and cultivars in the collection, therefore the overall contribution of the genus to the collection is high. On the other hand, *Trochodendron*, which also scores highly, has only one representative and so its overall contribution to the collection is less.

Table 2.3 Genera at Eastwoodhill ranked according to Average score

Genus	Average score	Rank	Genus	Average score	Rank
<i>Magnolia</i> *	9.44	1	<i>Cornus</i>	8.22	33=

<i>many entries lower than 4.8</i>		
<i>Pyrus</i>	2.05	

Weighted score = Average score x percentage. Where percentage is 'Number of species and cultivars of that genus at EWH as a percentage of the total number of species and cultivars at EWH'. Percentages can be found in Table 2.2.

This score allows us to assess the collection as it is at present in terms of the contribution of a particular genus of plants to the collection. It helps us separate botanically very important genera of which there are many species and cultivars, from botanically important genera of which there are few examples. For example compare *Acer* with *Trochodendron*. *Acer* scores highly botanically and there are many species and cultivars in the collection, therefore the overall contribution of the genus to the collection is high. On the other hand, *Trochodendron* which also scores highly, has only one representative and so its overall contribution to the collection is less.

Table 2.6 Families ranked for combined weighted score

Family	Weighted total . WT= \sum (Av x N#)	Mean of average score for genera in this family	Number of key genera in this family	Number of genera at Eastwoodhill that belong to this family
Rosaceae	2704.28	7.00	three	35
Aceraceae	1231.46	9.19	one	1
Pinaceae	1195.05	7.75	three	8
Fagaceae	1148.06	7.66	two	5
Oleaceae	780.91	6.60	-	13
Cupressaceae	695.98	6.78	three	8
Betulaceae	688.91	7.31	two	5
Magnoliaceae	662.15	8.35	one	6
Fabaceae	537.61	6.69	-	32
Caprifoliaceae	370.06	6.62	-	?
Myrtaceae	291.89	6.26	-	12
Salicaceae	284.48	6.80	-	2
Saxifragaceae	254.93	7.12	-	8
Ranunculaceae	233.25	7.30	-	2
Ulmaceae	199.76	7.13	-	3
Aquifoliaceae	189.06	8.22	One	1

Berberidaceae	172.05	6.63	-	3
Hamamelidaceae	166.83	7.57	-	10
Taxodiaceae	156.68	7.70	-	9
Celastraceae	142.58	6.30	-	5
Bignoniaceae	141.73	6.95	-	9
Tiliaceae	141.60	8.33	One	2

Weighted total for any family = the sum of (average score x number of species and cultivars at Eastwoodhill) for each genus in the family.

All others weighted total below 100

Table 2.7 Lists of additional species and cultivars present in other collections. Data from MacKay (1990a).

Genera listed: *Abies*, *Acer*, *Aesculus*, *Alnus*, *Betula*, *Fagus*, *Juniperus*, *Malus*, *Prunus*, *Pyrus*, *Quercus*, *Tilia* *Magnolia* and *Ilex* are listed separately in the detailed exercise on those two genera.

ABIES

- Abies balsamea* 'Nana'
- Abies borisii-regis*
- Abies x bornmuelleriana*
- Abies chensiensis* var. *ernestii*
- Abies cilicica*
- Abies concolor* 'Lowiana'
- Abies delavayi* var. *smithii* female.
- Abies ernestii* var. *salouenensis*
- Abies equi-trojana*
- Abies fargesii*
- Abies lasiocarpa* 'Arizonica'
- Abies lasiocarpa* 'Arizonica Compacta'
- Abies marocana*
- Abies magnifica* var. *lasiocarpa*
- Abies magnifica* var. *shastensis*
- Abies nephrolepis*
- Abies nordmanniana* male
- Abies pardei*
- Abies pindrow*
- Abies pinsapo* ssp. *marocana*
- Abies procera* 'Glaucia'
- Abies religiosa* var. *emarginata*
- Abies sachalenensis*
- Abies siberica*
- Abies spectabilis*
- Abies vejari*

ACER

- Acer circinatum* x *palmatum*
- Acer franchetti*
- Acer micranthum*
- Acer nikoense* x *griseum*
- Acer ningapense*
- Acer palmatum* several varieties
- Acer platanoides* 'Laciniatum'
- Acer platanoides* 'Rubrum'
- Acer platanoides* 'Waldsteini'
- Acer pseudoplatanus* 'Prince Handjerg'

Acer pseudoplatanus 'Victoria'

- Acer rubrum* 'Scanlon'
- Acer sieboldianum* var. *macrophyllum*
- Acer tartaricum*

AESCULUS

- Aesculus indica* 'Sydney Pearce'
- Aesculus indica* 'Tibettii'
- Aesculus neglecta* 'Erythroblastos'
- Aesculus neglecta* 'Harbisonii'

ALNUS

- Alnus glutinosa* 'Imperialis'
- Alnus maximowiczii*
- Alnus sinuata*
- Alnus viridis*

BETULA

- Betula alnoides*
- Betula corylifolia*
- Betula cylindrostachya*
- Betula davurica*
- Betula ermanni ganjuensis* ?
- Betula* 'Jegymyns'
- Betula macrophyllum*
- Betula nana*
- Betula nigra* 'Gallen'
- Betula pendula* 'Purpurea'
- 'Purple Splendor'
- 'Youngii'
- Betula platyphylla* 'Purpurea'

FAGUS

- Fagus sylvatica* 'Ansorgei'
- 'Aurea Pendula'
- 'Dawyck Gold'
- 'Dawyck Purple'
- 'Swat Magret'

Quercus x heterophylla

Quercus incana

Quercus laurifolia

Quercus petraea ‘Fastigiata’

Quercus prinus x *canariensis*

Quercus serrata ‘Aurea’

Quercus virginiana

also see Hackfalls Arboretum catalogue

TILIA

Tilia japonica

Tilia megaphylla

Tilia orbicularis

Tilia platyphyllea ‘Rubra’

SECTION THREE: DEVELOPMENT OF THE GENUS MAGNOLIA AT EASTWOODHILL**Table 3.1** Information on the genera under consideration

<i>Genus</i>	Number of species and cultivars at Eastwoodhill (N.)	N as a percentage of total number of species and cultivars at Eastwoodhill (%)	Average score (Av.)	Weighted score W=%xAv.	Ranked for N	Ranked for W	Ranked for Av.
<i>Liriodendron</i>	2+2 =4	0.18	7.65	1.37	nr	nr	nr
<i>Magnolia</i>	33+28=61	2.87	9.44	27.09	5	4	1
<i>Manglietia</i>	1+0 =1	0.047	8.67	0.40	nr	nr	12=
<i>Michelia</i>	3+1 =4	0.18	8.00	1.44	nr	nr	nr
<i>Schisandra</i>	2+0 =2	0.09	7.36	0.66	nr	nr	nr
<i>Talauma</i>	1+0 =1	0.047	9.00	0.42	nr	nr	6

'Number at Eastwoodhill' is expressed as species + cultivars = total.

'Number as % of collection' expresses the number of species and cultivars of that genus as a percentage of the total number of species and cultivars in the collection.

nr = not ranked

Table 3.3: Portion of the genera represented at Eastwoodhill

<i>Genus</i>	Number of species in genus	Reference	Number of species at Eastwoodhill	N as % of total number of species
<i>Liriodendron</i>	2	H3, K	1	50
<i>Magnolia</i>	80-85	K, H3	33	41
<i>Manglietia</i>	30	K	1	3.3
<i>Michelia</i>	45-50	K, H3	3	6
<i>Schisandra</i>	25	K, H3	1	4
<i>Talauma</i>	40	H3	1	3.3

Notes

-The number at EWH include only the species, not the cultivars. The percentage is worked out on that basis.

-H3 is Hortus III, K is Krussman.

<i>Magnolia wilsonii</i> ‘Lord Wakehurst’

Table 3.4 Extensions of the genera

MAGNOLIACEAE: 12 genera.

Aromadendron: 3 species from Malaysia and China. Not in cultivation according to Krussman.

Alcimandra: 1 species from the Himalaya. *A. cathcartii*

Liriodendron: 2 species, 1 already present. The other is *L. chinense*.

<i>Michelia</i> :	<i>champaca</i>	Himalaya
	<i>formosana</i>	Taiwan
	<i>nilagirica</i>	India
	<i>sinensis</i>	China
	<i>velutina</i>	Himalaya
<i>Schisandra</i> :	<i>chinensis</i>	Asia
	<i>coccinea</i>	USA
	<i>henryi</i>	China
	<i>propinqua</i>	China
	<i>repanda</i>	Japan, Korea
	<i>sphaerandra</i>	China
	<i>sphenanthera</i>	China
<i>Talauma</i> :	1 species, already present	

Table 3.5 Suggested acquisitions for Eastwoodhill

Group members suggested the following plants:

<i>Ilicum</i> sp.	<i>Magnolia parviflora</i>
<i>Kadsura japonica</i>	<i>Magnolia</i> 'Purple Globe'
<i>Liriodendron chinense</i>	<i>Magnolia rostrata</i>
<i>Magnolia</i> , tropical species.	<i>Magnolia scheideana</i>
<i>Magnolia ashei</i>	<i>Magnolia sinensis</i>
<i>Magnolia brooklynensis</i> 'Evanorii'	<i>Magnolia</i> 'Sundance'
<i>Magnolia</i> 'Caerhays Belle'	<i>Magnolia virginiana</i> 'Autumn Delight'
<i>Magnolia campbellii</i> cultivars	<i>Magnolia</i> 'Vulcan'
<i>M. campbellii</i> ssp. <i>mollicomata</i> 'Lanarth'	<i>Magnolia</i> 'Wadas Memory'
<i>M. campbellii</i> ssp. <i>mollicomata</i> 'Kew Surprise'	<i>Magnolia watsonii</i>
<i>M. campbellii</i> ssp. <i>mollicomata</i> 'Maharajah'	<i>Magnolia</i> 'Yellowbird'
<i>Magnolia dealbata</i>	<i>Michelia yunnanense</i>
<i>Magnolia denudata</i> 'Purple Eye'	<i>Michelia</i> , carefully sited
<i>Magnolia fraseri</i>	<i>Talauma mexicana</i>
<i>Magnolia globosa</i>	
<i>Magnolia grandiflora</i> 'Little Gem'	
<i>Magnolia grandiflora</i> 'Samuel Somers'	
<i>Magnolia grandiflora</i> x <i>virginiana</i> 'Freeman'	
<i>Magnolia</i> 'Leonard Messel'	
<i>Magnolia</i> 'Mark Jury'	
<i>Magnolia</i> 'Michael Rosse'	

{Tables 3.6-3.8 no longer exist. The exercise, as originally planned, also included *Ilex*, but that part of the exercise that was never conducted due to shortage of time. The tables have been removed from this record.}

Table 3.9 Magnolia ranking for botanical score

Species	Botanical score	Rank	Number of individuals of that species or cultivar at Eastwoodhill		Aesthetic score
<i>Magnolia coco</i>	9.2	1	1		5.2
<i>Magnolia nitida</i>	9.0	2	0		8.6
<i>Manglietia insignis</i>	9.0	2=	0		8.4
<i>Manglietia hookeri</i>	8.8	4=	1		8.4
<i>Talauma hodgesonii</i>	8.8	4=	1		8.4
<i>Magnolia sprengeri var. diva</i>	8.8	4=	1		9.8
<i>Mag. sargentiana var. robusta</i>	8.6	7=	1		9.8
<i>Michelia compressa</i>	8.6	7=	1		6.0
<i>Schisandra coccinea</i>	8.6	7=	1		6.8
<i>Magnolia dawsoniana</i>	8.4	10=	1		9.0
<i>Magnolia macrophylla</i>	8.4	10=	3		8.4
<i>Magnolia officinalis</i>	8.4	10=	0		7.2
<i>Michelia doltsopa</i>	8.2	13=	3		9.2
<i>Magnolia campbellii</i>	8.2	13=	3		9.8
<i>Magnolia campbellii f. alba</i>	8.2	13=	1		9.8
<i>Magnolia cylindrica</i>	8.2	13=	2		7.8
<i>Magnolia officinalis var. biloba</i>	8.0	17	2		7.2
<i>Magnolia fraseri</i>	7.8	18	0		7.4
<i>Magnolia hypoleuca</i>	7.6	19=	0		7.4
<i>Magnolia wilsonii</i>	7.6	19=	2		8.4
<i>Liriodendron tulipifera</i>	7.4	21	3		8.0
<i>Michelia figo</i>	7.2	22=	3		6.2
<i>Magnolia 'Charles Raffill'</i>	7.2	22=	1		9.4
<i>Magnolia denudata</i>	7.2	22=	1		8.2
<i>Magnolia grandiflora</i>	7.2	22=	17		7.8
<i>Magnolia delavayi</i>	7.0	26=	4		7.6
<i>Magnolia sieboldii</i>	7.0	26=	2		8.0
<i>Magnolia tripetala</i>	7.0	26=	2		6.0
<i>Magnolia virginiana</i>	7.0	26=	0		6.4

Table 3.10 Magnolia ranking for aesthetic score

Species	Aesthetic score	Rank	Number of individuals of that species or cultivar at Eastwoodhill	Botanical score
<i>Magnolia campbellii</i>	9.8	1	3	8.2
<i>Magnolia campbellii f. alba</i>	9.8	1=	1	8.2
<i>Magnolia sargentiana</i> var. <i>robusta</i>	9.8	1=	1	8.6
<i>Magnolia sprengeri</i> var. <i>diva</i>	9.8	1=	1	8.8

SECTION FOUR: MANAGEMENT PLAN FOR PEAR PARK**Table 4.1 Arboretum key genera in Pear Park**

<i>Key genus</i>	Present in Pear Park	Number of species and cultivars in Pear Park	No. of species and cultivars in Pear Park as a percentage of the number of species and cultivars in the current collection.	Are the plants sole examples
<i>Abies</i>	yes	1	2.7	no
<i>Acer</i>	yes	19	14	yes
<i>Aesculus</i>	yes	6	28	yes
<i>Alnus</i>	yes	2	6.89	no
<i>Betula</i>	yes	3	7.5	no
<i>Fagus</i>	yes	4	23	no
<i>Ilex</i>	no	0	0	-
<i>Juniperus</i>	yes	12	41	yes
<i>Malus</i>	yes	17	27	yes
<i>Magnolia</i>	yes	1	1.6	no
<i>Picea</i>	no	0	0	-
<i>Pinus</i>	no	0	0	-
<i>Prunus</i>	yes	6	5.6	no
<i>Pyrus</i>	yes	3	50	no?
<i>Quercus</i>	yes	24	24	yes
<i>Tilia</i>	yes	8	47	yes

Table 4.2: Park key genera

<i>Genus</i>	Average score	Number of species and cultivars in Pear Park	Number of species and cultivars in Pear Park as a percentage of number of species and cultivars in the current collection	Are the plants sole examples.
<i>Celtis</i>	6.83	3	42	yes
<i>Crataemespilus</i>	8.17	2	100	yes
<i>Crataegomespilus</i>	8.13	1	100	yes
<i>Crataegus</i>	7.56	13	36	yes
<i>Emmenopterys</i>	8.83	1	100	yes
<i>Fraxinus</i>	7.61	15	48	yes
<i>Gleditsia</i>	7.22	3	23	no
<i>Platanus</i>	7.22	4	36	yes
<i>Platycarya</i>	8.50	1	100	yes
<i>Stuartia</i>	8.89	1	14	no
<i>Buddleia</i>	6.35	3	15	yes
<i>Viburnum</i>	8.00	1	4.5	yes

Park key genera as proposed by the author.

Sole examples - if answered yes, then there are members of that genus in Pear Park that are the only representative of the species at EWH.

Table 4.3 Plants previously present in Pear Park

Plants listed for Pear Park by W D Cook - but which are no longer present.

Bottom corner by Aesculus pyramidalis

Sorbus domestica
Sorbus intermedia
Sorbus folgneri 'Pendula'
Sorbus gracilis
Sorbus hupehensis 'Aperta'
Sorbus megalocarpa
Sorbus mougeotii
Sorbus pohuashanensis
Sorbus rehderiana
Sorbus commixta
Sorbaronia fallax?
Sorbus arranensis
Sorbus aucuparia 'Asplenifolia'
Quercus pedunculata 'Purpureascens'
Malus glabrata
Malus 'John Downie'

Lime corner going up towards the ashes

Tilia tuan
Castanea macrocarpa
Castanea mollissima
Castanea alnifolia
Castanea sativa 'Heterophylla'
Castanea crenata
Castanea dentata
Quercus sessiflora 'Rubicunda'
Quercus pontica

Hawthorns to ashes and further

Crataegus holmesiana
Crataegus macrantha
Fraxinus griffithii
Quercus myrsinifolia
Tilia moltkei

Zanthoxylem and up

Ostrya japonica
Fraxinus paxiana
Zelkova davidiana

Near two catalpas

Aesculus neglecta
Aesculus mutabilis 'Harbisoni'
Aesculus georgiana
Philadelphus 'Favourite'

Philadelphus 'Belle Etoile'

Philadelphus 'Etoile Rose'
Aesculus glaucescens
Cotoneaster moutpinensis

Below cottage

Clethra asplenifolia
Clethra fargesii
Acer triflorum
Acer mandshuricum
Acer fargesii
Acer tschonoski
Acer tartaricum
Acer erianthum
Rhus canadensis
Diervilla styracea
Hypericum aureum
Hypericum hircinum
Cornus macrophylla
Cornus stolonifera 'Flaviramea'

Salix fargesii
Salix alba 'Vitellina'
Photinia beauvardiana

Near Emmenopterys

Quercus incana
Halesia monilicola
Crataegus uniflora
Tsuga yunnanensis

Near junipers

Parrotiopsis jacquemontii
Fagus japonica
Malus baccata var. *macrocarpa*
Malus baccata var. *mandshurica*
Malus 'Lady Northcliffe'
Malus 'Wisley Crab'
Pyrus wilsoniana
Sorbus aria 'Majestica'

Cabbage tree walk

Acer japonicum
Acer davidii
Viburnum fragrans
Styrax japonicum
Enkianthus pulverulentus

<i>Hamamelis mollis</i>	<i>Lonicera syringantha</i> (bills)
<i>Malus purpurea</i>	<i>Malus x micromalus</i>
<i>Hymenosporum sp.</i>	<i>Malus toringoides</i> (the ride)
<u>Notes in Bean</u>	
<i>Acer trautvetteri</i>	<i>Quercus garryana</i> (3 in PP, sheep yards gate)
<i>Anthyllis barba-jovis</i>	<i>Quercus imbricaria</i>
<i>Buddleia davidii rosea-floribunda</i>	<i>Quercus libani</i>
<i>Carpinus caroliniana</i>	<i>Quercus macrocarpa</i>
<i>Castanea sativa</i> 'Maron de Lyon'	<i>Quercus myrsinaefolia</i>
<i>Crataegus crus-galli</i>	<i>Quercus robur</i> 'Purpureascens'
<i>Euonymus suave</i>	<i>Sorbus chrysophylla</i>
<i>Jasminium nudiflorum</i>	<i>Sorbus majestica</i>
<i>Lonicera syringantha</i>	<i>Sorbus aucuparia</i> 'Fructo Lutea'
<i>Prunus conradinae</i> 'Flore Plena'	<i>Viburnum dentatum</i> (the ride)
<i>Quercus ilicifolia</i>	<i>Viburnum fragrans</i> (bills garden)
<i>Quercus macrocarpa</i>	
<i>Quercus pontica</i>	
<i>Ulmus carpinifolia</i> 'Pendula'	

According to notebook 20

<i>Abies nordmannia</i>
<i>Acer rubrum sanguinuem</i> (the ride)
<i>Acer saccharum</i> (the ride)
<i>Amelanchier canadensis</i>
<i>Anagyris foetida</i> (under buddleia below bills)
<i>Anthyllis barba-jovis</i> (below bills)
<i>Callicarpa purpurea</i> (below bills)
<i>Camellia</i> 'Bonomania', 'Candidissima' (bills)
'Prince Frederick William' (at bills on bank)
'Spencers Pink', 'Wabusuki'
<i>Crataegus ivensae</i>
<i>Crataegus macrantha</i>
<i>Crataegus punctata</i>
<i>Euonymus alatus</i> (bills)
<i>Euonymus atropurpureus</i> (below bills)
<i>Euonymus intermedium</i> (below bills)
<i>Euonymus suave</i> (below bills)
<i>Euonymus maackii</i> (the ride, bills)
<i>Fraxinus nigra</i> (down drive, sheep yards)
<i>Fraxinus oregona</i> (Douglas Park, Pear Park)
<i>Fraxinus heterophylla</i>
<i>Fraxinus griffithii</i>
<i>Fraxinus americana</i> (sheep yards, drive edge)
<i>Fraxinus angustifolia</i>
<i>Fraxinus angustifolia lentiscifolia</i>
<i>Fraxinus angustifolia oxycarpa</i>
<i>Fraxinus americana acuminata?</i>
<i>Gymnocladus dioicus</i> (the ride)
<i>Laburnum alpinum</i> (bills path)

SECTION FIVE: DEVELOPMENT OF THE COLLECTION - BUSH AREA**Table 5.1** Species already in the bush area

Planted

Agathis australis
Coprosma australis
Cordyline australis
Dacrydium cupressinum
Griselinia littoralis
Knightia excelsa
Pittosporum crassifolium
Pittosporum eugenoides
Pittosporum sp
Podocarpus totara
Phyllocladus sp
Pseudopanax crassifolium
Nothofagus fusca
Nothofagus solandri
Schefflera sp
Sophora sp

Self-seeded species

Betula pendula
Celastrus sp
Coprosma sp
Cotoneaster sp
Cornus capitata
Leptospermum scoparium
Prunus campanulata
Prunus cerasifera 'Atropurpurea'
Pinus radiata
Salix sp.

Trees planted on the margins

Cedrus atlantica f. glauca
Fagus sylvatica
Quercus palustris
Fagus sylvatica 'Purpurea'
Taxodium distichium

Table 5.2 South American Flora already at Eastwoodhill

<i>Abutilon striatum</i> 'Thompsoni'	<i>Quillaja saponaria</i>
<i>Ahnus jorulensis</i>	<i>Rhapithamnus spinosus</i>
<i>Araucaria araucana</i>	<i>Schinus molle</i>
<i>Aristotelia chilensis</i>	<i>Schinus terebinthifolius</i>
<i>Austrocedrus chilensis</i>	<i>Solanum rantonetti</i>
<i>Azara integrifolia</i>	<i>Tibouchina semidecandra</i>

(Information from Krussman, 1984,1985)

APPENDIX: Rating scales used in field exercises

HEALTH

- 1 Unlikely to survive
- 2 Alive, poorly furnished, signs of stress, dying back
- 3 Fully furnished, signs of stress, not growing
- 4 Well furnished, healthy, no stress signs, growing slowly.
- 5 Well furnished, healthy, no stress signs, growing vigorously, .

AS AN EXAMPLE OF THE SPECIES

- 1 Not representative of the species, all factors unsatisfactory
- 2 Poor example of the species, three factors unsatisfactory
- 3 Identifiable example of the species, two factors unsatisfactory.
- 4 Good example of the species, only one factor unsatisfactory
- 5 Excellent, all factors good.

Factors

- health
- association with other trees
- form (shape)
- form (structure)

GROWTH PHASE

- 1 Senescent - not growing, declining canopy.
- 2 Mature - adult features, growth regenerative
- 3 Immature vigorous - adult features, growth vigorous
- 4 Juvenile vigorous - established, in rapid growth, juvenile features
- 5 Establishment - Plant still establishing, not yet growing

APPENDIX: List of Participants in the second workshop

Mr Bob Berry, Plantsman and Farmer, Hackfalls Arboretum, Gisborne.
Mr Spencer Bush, Arboretum Supervisor, Gisborne.
Mr Peter Cave, Nurseryman, Cambridge.
Professor David Chalmers, Professor of Horticultural Science, Massey University.
Mr Garry Clapperton, Curator, Eastwoodhill.
Mr Gordon Collier, Consultant and Plantsman, Taihape. (Surveys only)
Mr Rodney Faulkner, Farmer and Arboretum Trust Board, Gisborne.
Mr Ron Gordon, Farmer and Plantsman, Taihape.
Mr Michael Hudson, Plantsman and Farmer, Hawkes Bay.
Mr Allan Jellyman, Community Services Director, New Plymouth. (Surveys only)
Mrs Marion MacKay, Department of Horticultural Science, Massey University.
Mr Ian McKean, Farmer and Plantsman, Rangiwahea.
Mr Paul Pollock, Nurseryman and Arboretum Trust Board, Gisborne.
Dr Bill Sykes, Botanist, D.S.I.R. Land Resources Division, Christchurch.

Report of the third workshop

Camellia 'C.H.Hovey', Cabin Park, September 1988.

REPORT OF THE THIRD EASTWOODHILL ARBORETUM WORKSHOP:
ASPECTS OF COLLECTION DEVELOPMENT AND EXPANSION

Held at Eastwoodhill on 16-17 March 1991

Marion MacKay
Massey University, Palmerston North

Eastwoodhill Publication No. 6

Published 1991

Contents

SECTION ONE: Issues.

SECTION TWO: Development of the genus *Acer* at Eastwoodhill.

SECTION THREE: Development of the new area.

SECTION FOUR: Management plan for Orchard Hill.

SECTION FIVE: Management plan for Basinhead.

SECTION SIX: Conclusions.

APPENDIX ONE: Programme.

APPENDIX TWO: Tables referred to in the text.

APPENDIX THREE: Rating scales used for field exercises.

APPENDIX FOUR: List of participants.

Footnote: The workshop report in this thesis has been slightly modified from the original. Format has been modified slightly for this thesis. Content has been modified with respect to the plans of Orchard Hill and Basinhead, which have been removed in this version. The reader is referred to the same plans in thesis Appendix Two. Content has also been modified with the addition of the programme as an extra appendix.

Resume

In March 1991 the Eastwoodhill Plant Management Committee met for the third time to consider aspects of management and development of the collection of plants at the Eastwoodhill Arboretum. These deliberations are subsequent to the second workshop.

The genus *Acer* was given detailed consideration at this workshop. Preliminary surveys established the most important members of the genus at Eastwoodhill, field exercise and subsequent discussion resulted in the formulation of a strategy for the development of this genus at the Arboretum.

The management of Orchard Hill was carefully considered using park evaluation and decision making methods developed at previous workshops. The current plantings in the park were considered in light of the objectives for the park. Individual trees were assessed for a number of factors, the results being used as a planning basis for the park. A long term strategy for the park is proposed.

The Committee was introduced to the 150 acres of land which belongs to the Arboretum but which as yet is unplanted and requires development planning. Important character elements of the present Arboretum, and the principle of key genera, were examined with respect to development of this new area. A method for the formulation and implementation of development plans for this area was proposed.

Following on from an exercise initiated at the second workshop, the committee re-examined the Basinhead area. A full assessment of the area was carried out and the results used as a basis for a management proposal.

This workshop was conducted under the auspices of the Eastwoodhill Arboretum Trust Board.

SUMMARY OF RECOMMENDATIONS

Section One: Issues

- That the renovation of Birch Hill be undertaken in the manner described in section 1.2.5.
- That a landscape architect be appointed as part of the subgroup who are examining the new area.
- That the key genera list, as stated in the report of the second workshop, be reconfirmed.

Section Two: The genus *Acer*

- That the actions recommended from the *Acer* field exercise, as outlined in table 2.3.2, be implemented.
- That the genus *Acer* be developed according to the recommendations in section 2.5.

Section Three: New area development

- That the new area should be of compatible character to the present Arboretum.
- That the incorporation of all, or some, of the elements listed in table 3.3.1.1 into the new area will ensure that it has similar character to the present Arboretum.
- That the incorporation of the elements listed in table 3.3.1.2 is important to the successful development of the new area.
- That the principle of key genera be continued in any development of the new area. This should follow the guidelines described in section 3.3.2.
- That a method for site development be formulated based on the principles outlined in section 3.3.3.
- That the procedure for site development, as outlined in table 3.3.3.1 be implemented.
- That a subcommittee of Mr Clapperton, Mr Jellyman, and Mr Collier be charged with undertaking step one of the method in table 3.3.3.1, in time for consideration at the next workshop.

Section Four: Management of Orchard Hill

- That the development of Orchard Hill follow the themes outlined in section 4.3.
- That the general identity of Orchard Hill should be retained, i.e. spring blossom featuring *Malus*, *Prunus*, and *Magnolia*, with coniferous background of *Picea*, *Abies*, and *Pinus*.
- That the plan of action for Orchard Hill, as outlined in section 4.5.2, be implemented.
- That after recommended trees have been removed from the park, a reconsideration of the plantings should be done.
- That the renovated planting scheme should feature: (i) Spring display and autumn colour highlights, (ii) A range of high impact *Malus* and *Prunus* types, (iii) *Prunus* types that tend towards species rather than cultivars.
- That a proposal for reselected *Prunus* and *Malus* species be brought to the committee for consideration at its next meeting.

Section Five: Basinhead

- That the plan of action for Basinhead, as outlined in table 5.4.2, be implemented.
- That a plan for the redevelopment of Basinhead, which takes account of permanent and transitory elements, and spring display, be undertaken.

Section Six: Conclusion

- That the fourth workshop be held in March 1992.
- That the fourth workshop address issues such as suggested in section 6.2.

SECTION ONE: Issues

1.1 Aim

To consider any issues relating to previous workshops, reports, and associated progress at the arboretum. Three issues that arose during the workshop are also reported here.

1.2 Issues discussed

1.2.1 Douglas Cook Centre for Education

Mr Pollock reported on the development of the Douglas Cook Centre for Education. This study centre has been established at the Arboretum over the last year. Community fundraising by the Friends of Eastwoodhill has resulted in a fully funded and constructed centre which contains library, laboratory, herbarium, offices, kitchen, and public facilities. This successful development is exciting progress for the Arboretum. The committee visited the centre and inspected the facilities.

1.2.2 Student activities

Professor Chalmers reported on student activities at the Arboretum. The activities of Massey University students using the Arboretum for educational purposes was described. Mr Clapperton then outlined the activities of the Waikato polytechnic group.

1.2.3 Gondwana development

Mr Clapperton reported on the Gondwana development within the native planting area. Progress to date was outlined. So far the majority of the noxious weeds have largely been eliminated, sheep will now be used to keep the ground tidy. Some information on possible planting regimes for this area will be forthcoming from Mr B.Clarkson D.S.I.R., and a contact in MAF who has a collection of South American plants.

1.2.4 Progress in Pear Park

Mr Clapperton reported on the progress made in Pear Park with respect to the recommendations from last year's report. The committee visited the park and were acquainted with the developments. The Waikato polytechnic group had done much of the work as part of their annual exercises. The area of the old nursery site had been substantially cleaned out and much seedling material removed. Major work had been undertaken in the area of *Quercus ludoviciana* with trees targeted for removal now gone. The fence between this area and the sheep yards has been removed and a large branch removed from a red oak, substantially altering the appearance of this area.

1.2.5 Birch Hill

The question of the renovation of the Birch grove on Birch Hill was raised. The current species is *B.pubescens* which is not suited to the site and has done poorly. Many of the trees are in poor condition and the overall quality of the hill is in decline. On examination of the Hill it was agreed that Douglas Cook's intentions were quite clear, i.e. a planting of one species for trunk effect. It was also agreed that to achieve unity one clone should be selected and used for the whole Hill. After discussion it was agreed that the following procedure be followed:

1. Remove crowding trees immediately.
2. Replant the whole Hill when a suitable number of trees have been obtained.
3. Use a clone of a white bark birch; *B.papyrifera* is suggested.

4. The removal of the shoulder off the edge of Birch Hill, on the pond side, would draw attention to the space and make it more open.
5. The use of copper bark birch on the flat area on top would add interest.

It was agreed that more information on a suitable clone and its availability was needed. A number of species were considered for the site. *B.costata* has a good trunk but was considered too broad in its shape. *B.x fetisowii* was thought to be too upright. *B.pendula* is too short lived. *B.papyrifera* was considered suitable because it has a slim shape and a good trunk.

1.2.6 Landscape architect

The incorporation of a landscape architect into the workshop group was discussed, particularly with respect to the new area. It was agreed that a landscape architect should be appointed to the subgroup that is working on the new area development.

1.2.7 Key genera

The key genera list, as listed in the second workshop report, was reconfirmed.

Summary of recommendations:

That the renovation of Birch Hill be undertaken in the manner described in section 1.2.5.

That a landscape architect be appointed as part of the subgroup who are examining the new area.

That the key genera list be reconfirmed.

SECTION TWO: Development of the collection - The genus *Acer***2.1 Aim**

To consider in detail the genus *Acer* at Eastwoodhill and formulate a development plan for the genus within the collection.

2.2 Background information and field exercise

The background information for this exercise was considered (Appendix Tables 2.1-2.8). The current Eastwoodhill collection contains 131 species and cultivars of *Acer*. This represents about 6% of the total species and cultivars in the collection. In addition another 45 species and cultivars were purchased by Mr Cook, but are no longer in the collection (Appendix Table 2.6).

In the overall assessment of the collection *Acer* ranked 3rd in terms of overall importance, *Magnolia* and *Tetracentron* were higher. Of the key genera *Acer* falls into the highest bracket of importance with an Average score of 9.2. In terms of number of species and cultivars at Eastwoodhill *Acer* is the leading genus. As a representation of the genus Eastwoodhill holds about 51% of the species within the genus (77 species present in the Arboretum).

The information on extent of the genus in New Zealand was examined (Appendix Table 2.7). In fact there are very few types present in New Zealand that are not represented at Eastwoodhill. The only species in New Zealand but not at Eastwoodhill are *A. franchetii*, *A. ningapense*, *A. sieboldianum* var. *macrophyllum* and *A. tartaricum*. In addition there are three *A. platanoides* cultivars and two *A. pseudoplatanus* cultivars.

The information on the subgroups within the genus was examined. Table 2.2.1 illustrates the divisions of the genus. Eastwoodhill has species from nearly all groups. Bill Sykes reports that of those which Eastwoodhill does not have, 70% are Chinese and most of the others are of Russian origin.

The preliminary assessment results for the genus were then considered (Appendix Tables 2.1-2.4). It is notable that the majority of the plants which ranked highly are represented by only one example. Many of the important species are generally poorly represented throughout New Zealand.

A field exercise to assess the quality of the actual plants on site was undertaken. Species for consideration were those that ranked highly in one or both of the preliminary assessments. In the field exercise individual examples were rated for health and as an example of the species. Rating scales can be found in Appendix Three.

2.3 Results

The results of the field exercise were calculated and discussed. It was agreed that a health score below 3.5 was unacceptable, and an 'example of species' score below 3.0 was unacceptable. Taking these levels into account, the recommendations from the field exercise were made. Table 2.3.1 contains the preliminary and field results for the species considered.

Table 2.2.1 Divisions within the genus *Acer*

This information is from DeJong, P.C. 1990. Taxonomy and distribution of *Acer*. International Dendrology Society Yearbook, 1990, pp 6-10.

Table 2.3.2: Acer field exercise - Recommendations

A. macrophyllum All scores acceptable. No action necessary.

A. pseudosieboldianum This was the highest rated of the maples in the initial assessment, however the actual specimen is not particularly notable. The growth is not marked and the tree appears to be suffering from borer. The health rating is below the acceptable level. This example also seems to be the only one of its type in the country so it is important that it should be propagated. The tree will need to be propagated from itself, preferably grafted onto its own seedlings and then several trees planted out.

A. fargesii This tree has suffered serious suppression and dieback due to insect attack. Several limbs have been ringbarked and have died about the point of attack, however strong new growths have occurred and the tree is capable of making good recovery if appropriately managed. The tree should be dead wooded again and then reshaped from the new vigorous growths.

A. sterculiaceum Both health and example scores are below the acceptable level. This tree urgently needs propagating and replanting onto a wetter site. It is particularly sensitive to dry and drops its leaves during dry periods. This tree also has some propagation difficulties and should be tried on *A. macrophyllum* as stock. Propagation should also be done from the tree at Hackfalls and the two types of material planted together.

A x zoeschense The tree is spindly and unthrifty. Both field scores are below the acceptable level. Other examples should be obtained and planted into other sites.

A. griseum All scores acceptable. No action necessary.

A. nikkoense There are two trees at the site near Birch Hill. The lower tree, nearer the stream, has an unacceptable health level and requires some action. Both trees should be left. The surrounding trees should be trimmed to give better light to these two maples. Specifically the Rhododendrons should be pruned back and the apples tidied up. The Japanese maples should be selectively pruned away from the Nikko maples. The maple grouping was favoured ahead of the Rhododendrons for this area. The birches on the other side of the track should be thinned to give the maples more room and light. These maples are small for their age, probably due to the poor pumice soil on the site.

A. campbellii The identity of this tree is debatable as it does not fit all the characteristics expected of the type. No fruits are produced and it could possibly be a hybrid. Material should be sent to van Gelderen for identification. Health is below par and some action is necessary. It has been propagated by Peter Cave but is very weak.

A. cappadocicum ssp. lobelii An excellent example. No action necessary.

.....continued

A. carpinifolium This tree is not growing well as it likes a wetter site. At present both field scores are below the acceptable level. This tree has been seriously suppressed by a conifer behind it which has since been removed. Subsequent to the removal of the suppressing tree this acer is recovering strongly. It should be tidied up. New seed material of Chinese origin has been supplied by Peter Cave.

A. grosseri var. hersi Field scores acceptable. No action necessary.

A. henryi Field scores acceptable. No action necessary.

A. hookeri This tree is quite crowded at the back and is suffering from some dieback and poor branches within the crown. At the same time, however, it is making strong recovery growth and therefore achieves a good health score. The dieback and twiggy branches should be removed. The crowding Rowan should be removed.

A. platanoides 'Palmatifidum' An excellent example. No action needed.

A. platanoides 'Goldsworth Purple' An excellent example. No action needed.

A. saccharinum 'Fastigiatum' An excellent example. No action needed.

A. velutinum var. vanvolxemi Both ratings satisfactory. No action needed.

A. diabolicum Both ratings unacceptable. This tree is rather crowded and appears in poor condition. However a *Cornus* has been removed which was strongly impinging on this tree and therefore the tree may make some improvement in the future. The tree should be tidied up and retained until another example is established.

A. miyabei Both ratings satisfactory. No action needed.

A. rubrum Excellent example. No action needed.

A. saccharum ssp. *nigrum* Both ratings satisfactory. No action needed.

A. buergerianum Excellent example. No action needed.

A. saccharum. This tree is in poor condition with both field ratings below par. Although this tree is more important than the surrounding *Liquidamber*, which are quite healthy, it was felt that the *Liquidamber* should be retained and some action taken on the Acer. Wild source seed should be obtained and the species replanted. This particular genetic source should be retained by propagating from this tree as well. The specimen examined should be removed once a new plant is established.

....continued

A. circinatum Although this tree is growing in a situation that might be considered typical for its type, the specific tree is not a good example of the species. Both ratings are below acceptable levels. The surrounding *Buddleia* should be rejuvenated to allow more light into the maple, and a branch lifted on the overtopping *Quercus mongolica*. In addition new wild source material should be obtained, it is readily available in the wild and it is not difficult to import seed. New Zealand material has a much more lobed leaf than this example and it is likely that the New Zealand types are hybrids with *A.palmatum*, this material should therefore be avoided.

A. diabolicum f. purpureascens Both ratings were satisfactory for this tree. There is a difficulty in the propagation of this species in that there is no suitable rootstock for grafting. It was suggested that *A.macrophyllum* might be tried as this is in the same series.

A. monspessulanum Both ratings acceptable. No action needed.

A. rubrum 'Brilliant' Excellent example. No action needed.

A. saccharum (Arnold Arboretum form) Excellent example. No action needed.

A. wilsonii Both ratings good. No action needed.

2.5 Development plan for the genus *Acer* at Eastwoodhill

The general discussion will be presented as a development plan.

Recommendations on the current collection.

- Types originally imported should be retained where possible. If a tree is declining then propagation should be carried out.
- Those special to Eastwoodhill, or rare in New Zealand, should be represented by more than one example.

Recommendation on the criteria for acquisition.

- Using the same criteria as were established for *Magnolia*; the policy should follow the following guidelines:
 - Concentrate on species. Try everything. If a species will not grow, then a herbarium specimen should be kept.
 - There is an obligation to hold unusual types for reference and educational purposes.
 - Any plant acquisition should pay attention to good form, climatic range, climatic suitability, site selection.

Recommendation of the acquisition of actual species and expansion of the genus.

- Those species that are in New Zealand should be obtained. Efforts should be made to ensure that obtained material is true to type. Seed grown material should be approached with caution as hybrids are very likely. Preferably material should be vegetatively propagated from true stock. If seed material is obtained then herbarium material should also be obtained for verification purposes.

- Any other species that become available should be obtained. The expedition to China later this year may make some new species available to New Zealand and Eastwoodhill. A list of the species not at Eastwoodhill should be forwarded to those on the China expedition.
- Wild source seed material should be obtained where possible.
- Where wild source seed is obtained several trees should ultimately be planted so that a true seed source can be generated. It is likely that wild source seed will become more difficult to obtain in the future so the development of a New Zealand seed source is useful. If this device is used then closely related species should be separated to try and avoid hybridization.

Recommendation on growth and siting of maples.

- Generally moister sites should be chosen for *Acer*. The area at the base of the new pinetum may be suitable for its richer and moister soil.
- Clay based soils should be chosen for *Acer* plantings. Some species such as *A.nikoense* and *A.griseum* are very poor on the pumice soils, and as a general observation the maples do not like the pumice soils. It is possible that the difficulties on pumice soils are fertility problems.
- Species that do not do well at Eastwoodhill should be repeated at Hackfalls to take advantage of the cooler climate.
- The incorporation of a shade canopy may be an advantage for many plantings. For example, the snakebarks in the Circus may improve if a tall canopy is planted on the sunny side. Equally the *Acer* on IDS ridge may benefit from a tall canopy.
- *Acer* as a genus seems to be environmentally sensitive for the Gisborne area. Most maples come from areas of moist summers. Information should be developed on those which will tolerate dry, moist, cool conditions etc.
- Climatic suitability must be the most important siting criterion. More data is needed on habitat.

2.6 Conclusions

There are some difficulties associated with the culture of the genus *Acer* at Eastwoodhill. This relates mostly to environmental sensitivity. Field results show that, even though some species are sensitive, others have performed very well. Careful siting, and further research into habitat and tolerances can overcome many of these problems.

Summary of recommendations:

That the actions recommended from the *Acer* field exercise, as outlined in table 2.3.2, be implemented.

That the genus *Acer* be developed according to the recommendations in section 2.5

SECTION THREE: Development of the collection - the next 150 acres

3.1 Aim

To develop a general philosophy and objectives for the development of the unplanted land at the Arboretum.

3.2 Background information and site visit

The background information was reviewed (Appendix Tables 3.1-3.5). First, the objectives for the Arboretum, as stated by Douglas Cook, were examined. Although Mr Cook never implicitly stated objectives, his writing contains statements that outline his intentions, (Appendix Table 3.1). Further to this information, the objectives as set out in the previous workshops were considered, (Appendix Table 3.2).

Next, the important physical characteristics were considered. The nature of the landscape elements that border the new area were listed, (Appendix Table 3.4). Generally there is a notable portion of coniferous material along the boundaries of the existing Arboretum, with some mixed deciduous elements.

After the initial briefing a site visit was made. {Readers of this thesis refer to Figure 1.4 in Volume I.} Mr Clapperton explained developments to date. Some planting has been done on the unstable slope which slipped in 1985, a DSIR poplar trial has been used to stabilise this ground (Wickham Hill). Adjacent and above the poplars is a planting of *Cupressus lusitanica* which will hold the hard dry slope behind. Because of the steepness of the site a pattern of planting was proposed. On the upper portions of the slopes, where it is too steep for easy pedestrian access, the coniferous backdrop plantings would be installed. Once the upper land is stabilised then deciduous highlights can be interplanted. The lower slopes would then be used for 'arboretum' planting. {The poplar trial is visible in the top left of Figure 5.1 in Volume I.}

It was proposed that the method described above be used on the western slopes and the central basin and slopes. The far 50 acres (Big Hill) must be treated differently. This area poses a considerable problem because the whole area is moving. A DSIR proposal for stabilisation of this ground should be received shortly. The priority for this area is deep stabilisation which must be achieved before any arboretum planting can be carried out.

A small area of remnant native vegetation was pointed out {Centre top of Figure 5.1 in Volume I}. It is planned that this area be left to regenerate into the vegetation of the area. This will be an asset to the region as there are very few places where local lowland vegetation is accessible to the public. It will also be of scientific interest.

The climatic features of the site were outlined. The basin is generally sheltered and shady. The western areas are windy.

3.3 Discussion

Following the site visit the development of the new area was debated at some length. Clearly any development will have to consider aspect, soil type, and slope and relate planting to those factors. There are, however, a number of issues that must be resolved before planting can be considered. These are the

development of the character of the site, the continuation of key genera, and the formulation of a method through which details of site development can be addressed. Each of these is considered below.

3.3.1 Aspects of arboretum character

In the current Arboretum there are a number of elements that give it a particular character.

In the first instance the principle of compatibility must be discussed. Should the new area have the same character as the present Arboretum, or should it be of quite different character? If the new planting is to blend in with the existing Arboretum, then it is important that these character elements be repeated in the new area. On the other hand if contrast is desirable then quite different elements would be used. After discussion it was agreed that the character should be similar in both areas.

Recommendation: That the new area should be of compatible character to the present Arboretum

If this principle is to be employed the elements that make up that character must be determined so that they may be utilised in the new plantings. Group discussion identified the following elements as being important in the present Arboretum.

Table 3.3.1.1 Character elements important in the present Arboretum

- Repeated evergreen elements, e.g. *Cedrus atlantica*, *Magnolia grandiflora*, *Magnolia delavayi*
- Conifer backdrop with deciduous highlights.
- Conifers on ridgetops.
- Varying concentration of conifers in each park.
- Features of particular evergreen plantings in some areas, e.g. the patula pines, pencil cypress.
- Backbone of red oaks.
- ‘Forests’ such as the beech wood, Black forest, the oak wood, and the maple forest.
- Planting groups with high impact, e.g. *Magnolia* and *Malus*, colourful plantings around the lakes.
- Specific special elements, such as the daffodil patch and miniature conifers.
- Open space areas such as the daffodil patch, the creation of small flat areas.
- Loosely clustered genera plantings, e.g. *Tilia*, *Ilex*, *Abies*, *Picea*, contrasted with other spread plantings.
- Occasional symmetrical elements within the park, e.g. fountain, shaltos.
- Presence of lakes in valley bottoms.
- Lookout points and high tracks.
- Tracks which follow contour rather than cut across contour.

Recommendation: That the incorporation of all, or some, of the elements listed in table 3.3.1.1 into the new area will ensure that it has similar character to the present Arboretum.

Having derived this list, discussion was held on the elements that were most desirable for the new area. The following were determined to be the factors most needed in the new area, stated in order of highest vote.

Table 3.3.1.2 Character elements that should be given priority in the development of the new area.

- Vistas and open space.
- Conifer backbone.
- Genera plantings.
- Demonstration areas where plant material for various uses can be grown, e.g. shelter trees, specimen trees, use of unusual species for woodlots, trees suitable for the district etc.
- ‘Forests’.
- Red oak and cedar backbone.
- Theme elements.

Recommendation: That the incorporation of the elements listed in table 3.3.1.2 is important to the successful development of the new area.

It is important that the distinction between the two lists above is noted. The first list gives a range of elements that could, and probably should, be employed to give the new area a similar look to the old area. The second list gives those elements that must be given careful consideration in the development of any plan for the new area, as these elements are seen as either lacking in the present Arboretum and/or important to successful development of the new area.

3.3.2 Key genera

The important issue here is whether or not the principle of key genera should be continued in the new area. If so, which key genera are most appropriate to develop. If not, then what other genera should be used.

Some discussion ensued. It was considered that there might be some pressure to deviate from the principle of key genera. First, there will be large quantities of new material coming into New Zealand from seed collecting expeditions and the interest in new material may not be compatible with the key genera principle. Second, it was felt that demonstration areas should not be constrained by the necessity of using key genera. However after some discussion it was agreed that the key genera should be continued.

Recommendation: That the principle of key genera be continued in any development of the new area.

Each genus was then considered individually and the following points made:

<i>Acer</i>	It is feasible to extend this genus, seed is readily available.
<i>Alnus</i>	This genus should be extended.
<i>Aesculus</i>	This genus should be extended.
<i>Betula</i>	This genus should be extended.
<i>Camellia</i>	This genus can be expanded but it can not be expected that all types can be collected. Many are too tropical for this area and would not be suitable. This genus could be extended quite soon as the material is available.
<i>Cedrus</i>	Continue with this genus.

<i>Crataegus</i>	This is a very large genus and most would grow here. It is not feasible to collect all though, so outstanding examples only should be acquired. Eastwoodhill is on the warmer end of the <i>Crataegus</i> range. This is an important small tree genus, which can fill an important visual role in the arboretum.
<i>Cupressus</i>	This genus should be extended, all species should be sought.
<i>Fagus</i>	This genus should be extended, all species should be sought.
<i>Ilex</i>	Many of this genus are tropical and will not grow here, so we could not expect to acquire any large portion of the genus.
<i>Juniperus</i>	This genus should be continued, but better sites chosen.
<i>Malus</i>	Continue with this genus.
<i>Magnolia</i>	This genus should be extended. <i>Magnolia</i> relatives should be acquired.
<i>Pinus</i>	Continue with this genus.
<i>Populus</i>	Continue with this genus.
<i>Prunus</i>	This genus is very difficult to import to New Zealand because of quarantine restrictions, it is therefore not feasible to extend this genus beyond what can be obtained in NZ.
<i>Quercus</i>	Continue with this genus.
<i>Tilia</i>	Continue with this genus.

Recommendation: That the key genera be continued into the new area in the manner described in section 3.3.2.

3.3.3 The formulation of a method for site development.

The committee discussed at length the mechanisms for site development. Mr Jellyman suggested that the brief that directed site development should show shelter planting, space definition, access, water features, and key spaces. It was not necessary to show specific planting sites. Essentially the main structure of the site must be correctly developed, and then the development of detail will follow.

It was agreed that a method must be formulated for site development. The method should:

1. Ensure that main structure and concepts are developed first, thus broad areas are defined.
2. Develop detail only after broad areas have been defined, then each subarea can be considered in detail. This step should consider the components and capabilities of each area, and look at habitat opportunities.
3. Utilise the combined skills of the committee to provide input into the planning of site development.

Recommendation: That a method for site development be formulated based on the principles outlined in section 3.3.3.

Recognising that such a procedure is desirable, it was proposed that the method outlined in Table 3.3.3.1 be followed. This method has a number of advantages. It sets broad guidelines for the whole area, and then more particular guidelines for each subarea. At the same time it does not constrain the curator by producing detail down to the planting location of a particular tree, neither does it constrain activities by having to wait for committee input before a particular tree can be planted.

Using this method means that a number of possibilities for each area can be explored, and the options fully discussed by the expert group. Group input should ensure that the best possible solution is reached and

justified. The guidelines developed will allow progress to be made in the periods between committee workshops.

Recommendation: That the procedure for site development, as outlined in table 3.3.3.1 be implemented.

Recommendation: That a subcommittee of Mr Clapperton, Mr Jellyman, and Mr Collier be charged with undertaking step one of the method in table 3.3.3.1, in time for consideration at the next workshop.

Table 3.3.3.1 Method for site development for the new area

Concept development#	Step	Committee inputs*
(i) Assessment of whole area. (ii) Identify a number of concepts for each subarea. (iii) Identify plant list for each concept, (categorise into dominant, understorey, focal).	1	
	2	(i) Examine area in question. (ii) Select concept. (iii) Evaluate planting proposal. (iv) Select plants to be used (dominant, theme, understorey). (v) Identify action plan for planting.
(i) Implement selected plan. (ii) Identify any issues.	3	(iii) Discuss and resolve.
Implementation.	4	

Concept development stages to be done by a subcommittee of Mr Clapperton, Mr Jellyman, and Mr Collier.

* Full committee input during workshop sessions.

3.4 Conclusion

The development of the new area is an exciting but complex part of Arboretum development. To ensure that the activities undertaken always make a positive contribution to that development it is suggested that the recommendations outlined below be followed.

Summary of recommendations:

That the new area should be of compatible character to the present arboretum.

That the incorporation of all, or some, of the elements listed in table 3.3.1.1 into the new area will ensure that it has similar character to the present arboretum.

That the incorporation of the elements listed in table 3.3.1.2 is important to the successful development of the new area.

That the principle of key genera be continued in any development of the new area. This should follow the guidelines described in section 3.3.2.

That a method for site development be formulated based on the principles outlined in section 3.3.3.

That the procedure for site development, as outlined in table 3.3.3.1 be implemented.

That a subcommittee of Mr Clapperton, Mr Jellyman, and Mr Collier be charged with undertaking step one of the method in table 3.3.3.1, in time for consideration at the next workshop.

SECTION FOUR: Park Management for Orchard Hill

4.1 Aim

The aim of this section was to develop a management strategy for Orchard Hill.

4.2 Description

Orchard Hill is on the eastern side of the arboretum facing Hihiroa Road. It is on a steep eastern facing slope with a basin at the bottom. The highest point within the Arboretum is at the top of the hill. The difficulties of terrain and the current state of the planting mean that the park is little visited, however there is some significant plant material on the site. Similarly, because Orchard Hill is the interface between the present Arboretum and the new area, the importance of this park will increase as the new area of the Arboretum is developed.

At approximately Sha Orchard Hill is a relatively small park within the Arboretum. It is accessed from the main walk to Douglas Park and has three main walking tracks cut into the hill face. The ground is unstable in places and has slipped a number of times, Orchard Hill is not conducive to pedestrian access unless tracks are formed. The site is cool and shaded compared with the rest of the arboretum as it receives only morning sun. The soil is very poor where the underlying rock is close to the surface, however, there are some areas of rich soils. The soils of the hill have been modified by slipping action.

The coolness and part shade of the site influenced Mr Cook to plant cool loving species there, e.g. *Ilex*, *Picea* and *Abies*. Planting on Orchard Hill began in the late 1950s. The current planting includes the main sites of Spruce, Fir and Pine within the Arboretum. *Malus*, *Prunus* and *Magnolia* are present in some concentration. The lower basin is presently not planted although it was the original site of Mr Cook's orchard and cherry plantings.

Plants currently in the park are illustrated by the park plans, sheets 16-17 of the arboretum set, and by the part plans A-D attached to this report. {Plans A-D are not included in this version of the report. Readers of this thesis should refer to the plans in thesis Appendix Two.} Plants that have been in the park, but which are no longer present are outlined in Appendix Table 4.8.

Because of the large number of *Malus* and *Prunus* on Orchard Hill, a large portion of the planting is reaching the end of its useful life. On the other hand, there are many trees which will continue to be viable for many years. As with other parts of the Arboretum, much of the planting is crowded. To ensure that the park as a whole is viable in the long term, management planning must be undertaken.

4.3 Objectives and theme for Orchard Hill

First, the reader is reminded of the relevant objectives for the Arboretum, as resolved at the first workshop: 'The theme of the Arboretum was that of temperate and warm temperate flora, focussing on the key genera plant groups that have already been identified', and that the role of the Arboretum is: 'To maintain and further the collection of Douglas Cook.'

With these objectives in mind the case of Orchard Hill can be examined. The manuscript 'Hollies at Eastwoodhill' (Appendix Table 4.1) illustrates that Douglas Cook had a number of objectives for this park. Mr Cook saw this park as a suitable site for *Magnolia*, *Ilex*, *Picea*, *Abies*, and *Pinus*. He intended that it should be formed with an evergreen background high on the Hill, interspersed with seasonal highlights such as *Prunus campanulata* and *Eucalyptus ficifolia*. *Abies*, *Picea* and *Pinus* were incorporated into the evergreen background, while *Ilex* and *Magnolia* were part of the 'arboretum' plantings on the lower part of the slope.

Much of Cook's intended outcome is apparent in Orchard Hill today. The following are important to the theme of this park:

1. Structurally, the evergreen background with seasonal highlights, and 'arboretum' plantings below is characteristic of this park.
2. Visually the element of spring display is important in this park.
3. The park is the key site for *Abies*, *Picea* and *Pinus* collections, which form an important element of the evergreen belt.
4. The bulk of the *Ilex* collection for the whole arboretum is found here.
5. The park is a suitable site for *Magnolia*.
6. Orchard Hill holds a large portion of the *Malus* and *Prunus* collections at the arboretum, these contributing significantly to the spring display.

Recommendation: That the development of Orchard Hill should follow the themes outlined in section 4.3.

4.4 Park evaluation - method

To evaluate the park the following procedure was followed:

1. Consideration of the current composition of the park and the background information relating to that composition.
2. Definition of permanent and transitory elements.
3. Field exercise.
4. Discussion of results and development of consensus on park management.

Background information

The composition of plant material on Orchard Hill was examined. The list of current plant material can be seen in Table 4.5.1, with the list of additional plants that were previously on the Hill found in Appendix Table 4.8.

Examination of these lists shows that 14 out of 19 key genera are represented on Orchard Hill. This park is an important site in the Arboretum for *Ilex* (47% on OH), *Pinus* (28% on OH), *Prunus* (19% on OH), and *Fagus* (17% on OH).

The distribution of other genera on Orchard Hill was considered. Orchard Hill is an important site for *Abies* (37% on OH), *Berberis* (42% on OH), and *Picea* (35% on OH). These figures clearly reflects Douglas Cook's intentions as stated in the previously mentioned manuscript.

The genera existing in greatest number today are *Prunus*, *Pinus*, *Abies*, and *Ilex*, (in descending order). Referring to the information on previous plantings, and rates of survival, (Appendix Tables 4.8,4.9) shows that *Magnolia*, *Acer*, *Abies* and *Euonymus* once existed in greater numbers than are present today.

The ratings of the plants on Orchard Hill for botanical and aesthetic merit were considered (Appendix Tables 4.2-4.6). It is notable that the highest ranking plants included a number of *Picea*, *Abies*, and *Magnolia*, this pattern is repeated for botanical score. Of the 25 highest rating plants overall, only 8 were key genera. This trend is repeated for botanical score, suggesting that key genera are not the most important group in this park. When aesthetic score is considered the pattern changes as the *Prunus* assume high positions and, being a key genus, do not continue the previous trend.

Permanent and transitory elements

Permanent elements are described as those that, when in an acceptable situation, are sufficiently long lived to be considered permanent. Transitory elements are described as those that are not long lived and will require regular replacement in relation to the permanent elements.

The discussion at the second workshop highlights the importance of the definition of permanent and transitory elements.

‘The definition of elements in this way allows the manager to distinguish those that will need regular attention and replacement from those that will not need such replacement. It is desirable that the framework of the park be formed from permanent elements, thus the framework of the park is always retained and is not disturbed by the need to recycle short lived material. The definition of the genera in this way does not necessarily mean that any will be removed from the park, it simply means that the transitional groups will need more intensive management to keep them at their best at all times.’

With respect to Orchard Hill a plan of the park was examined and the pattern of permanent (long lived) plantings was highlighted. The permanent elements were agreed to be: *Abies*, *Acer*, *Castanea*, *Fagus*, *Fraxinus*, *Juniperus*, *Magnolia*, *Picea*, *Pinus*, *Pseudotsuga*, *Quercus*. The transitory elements were agreed to be: *Crataegus*, *Ilex*, *Malus*, *Prunus*, and all other genera.

Generally the pattern shows that most of the upper plantings are of a permanent nature, while the majority of those on the lower slope are transitory (short lived).

Field exercise

Having considered the background information the trees were examined in the field. For each tree information on botanical and aesthetic score, height index, and number of individuals at Eastwoodhill was provided. The group then assessed each tree according to health, example of species, and contribution to scene. The rating scales for each of these indices is found in Appendix Three.

4.5 Park evaluation - Results

The results of the field exercise are reported in table 4.5.1. The overall results of the park evaluation can be found in table 4.5.2 and shown in areas A-F, which should be referred to concurrently. {Areas A-F are indicated on page 726, detail can be seen in plans in thesis Appendix Two}.

The consensus of the committee was that if a plant rated below 3.0 for field scores, then it should be removed, unless its botanical rating required that it be retained. A score of 4 or 5 is satisfactory. Field ratings have been summed and then an action category for each plant indicated. Field scores have been converted to a mark out of 10 for analysis. Using the levels just indicated the total scores were treated as follows:

- (i) average of field scores less than 2.0 (4.0) - urgent action required.
- (ii) average of field scores less than 3.0 (6.0) - action required in 0-5 years.
- (iii) average of field scores 3.0 to 4.0 (6.0-8.0)- okay, no immediate action required.
- (iv) average of field scores 4.0 (8.0) or more - tree excellent, no action required.

Table 4.5.1: Results sheet for field exercise

The Hollies and Abies: Area A

Plant	Ref. no.	Preliminary assessment					Field assessment				Status
		Rank for Av. score	Botan. score	Aesth. score	Height index	Status at EWH	Health	Example of species	Scene	Field average

() indicates a score from workshop one

Notes on *Picea* and *Abies* component as assessed at workshop one.

Decisions at that time were:

1. Urgent.

- Remove OH633
- Obtain new stock of *Abies amabilis*.
- Retain *Abies numidica*
- Remove *Abies wilsonii*.
- Propagate *Picea obovata*.

2. Action

- Obtain new stock of *Abies spectabilis* var. *brevifolia*.
- Obtain new stock of *Abies georgiana*.

3. Other

- Remove the Douglas Fir from above *Picea bicolor*.
- Remove the pine above *Picea morrisonicola*.
- Remove the Douglas Fir in association with *Picea spinulosa*
- Remove the smaller *Picea sutchuenensis*.

Segment of the arboretum plan showing the location of Orchard Hill.

Orchard Hill showing the location of the areas referred to in the results. Refer to the plans in thesis appendix two for detail.

After consideration of the field exercise it was agreed that if a tree rates below 3.0 (6.0) for field scores, then it should be removed, unless the botanical rating suggests otherwise. The recommendations below have taken this consensus into consideration.

Table 4.5.2 Results Orchard Hill exercise - Recommendations

If a plant is not mentioned specifically in the recommendations then no immediate action is required.

The Hollies and Abies (See area A.)

Urgent action required according to field results

Broussonetia papyrifera (OH653), average of field scores 2.0

Action required according to field results

Ilex cornuta, (OH621) average of field scores 2.9

Ilex (OH622) average of field scores 2.3

Ilex casine, (OH623), average of field scores 2.9

Ilex latifolia, (OH628) average of field scores 2.5

Recommendations - urgent.

1. Lift the branches of the overshadowing oak to give more light to the hollies. This should improve the situation of *I.latifolia*, (OH628).
2. Re-site the three small Hollies to a more spacious site. (OH615, 616,619). These bushes are relatively easily moved, and if left will make the current overcrowding worse.

Recommendations 0-5 years

1. Propagate and eventually remove the three centre hollies, (OH623, 622, 621). This will open out the centre of the group and give more room to the remaining plants.
2. The empty valley above the hollies should be used to replant species that need resiting from the existing group.
3. Propagate and resite the *Glochidion* (OH629).
4. Propagate *Broussonetia papyrifera* (OH653), to generate another of this sex in the arboretum.

Recommendations 5-10 years

1. Propagate *I.platyphylla* and *I.insignis* (OH626,627) to anticipate the need for eventual re-siting when they outgrow this site.

Comments

In general it was agreed that the Hollies are very healthy and are growing in an understorey situation that is suitable for this genus. However they are crowded and need to be propagated and the group as a whole given more room.

The Picea group (See area B)

This area was examined in 1989. It was not considered in need of further assessment as yet. Recommendations made for this area, at workshop one, are listed in table 4.5.1.

.....continued

The Pines (See area C)

Urgent action required according to field scores

Pinus montana var. *uncinata*, average of field scores 0.8

Action required according to field scores

Pinus sylvestris 'Argentea' (OH675), average of field scores 2.9

Pinus nigra var. *caramanica*, (OH600), average of field scores 2.7

Pinus nigra var. *corsicana*, (OH503), average of field scores 2.8

Pinus densiflora, (OH504), average of field scores 2.4

Pinus densiflora 'Umbraculifera', (OH502), average of field scores 2.7

Pinus halepensis, (OH501), average of field scores 2.7

Pinus parviflora, (OH505), average of field scores 2.7

Recommendations - urgent

1. Remove *Pinus montana* var. *uncinata*.
2. Propagate *Rhamnus californica* (OH575), in anticipation of removing it from its current position which blocks the track.

Recommendations 0-5 years.

1. Actions for complete removal of the species.
 - (i) Remove, without replacement, *Pinus montana* var. *uncinata*, and *Pinus densiflora* (OH504).
 - (ii) Remove from the upper slope *Juniperus x media* 'Blaauw', *Juniperus squamata* 'Meyeri', *Juniperus chinensis*, and *Juniperus chinensis* 'Pyramidalis'.
2. Actions for eventual replacement of the species, but removal of the existing specimen.
 - (i) Propagate, for replacement, *Pinus tabuliformis* (OH577), *Pinus densiflora* 'Umbraculifera' (OH502). Remove existing specimens once propagating material is established.
3. Actions needed on species to be retained
 - (i) Propagate *Pinus koraiensis* (OH580) to generate a better example as the existing tree has lost its top.
 - (ii) Propagate, or obtain new stock of, *Pinus sylvestris* 'Argentea' (OH 675) for eventual replacement, as the existing specimen is a poor example.
 - (iii) Undertake cleanup arboricultural work on *Pinus nigra* var. *corsicana* (OH503), *Pinus nigra* var. *caramanica* (OH600).

Far end below track (See area D)

Urgent action required according to field scores

Chamaecyparis lawsoniana 'Naberi', (OH662) average of field scores 0.8

Picea, (OH682) average of field scores 1.5

Juniperus 'Meyeri', average of field scores 1.9

Metasequoia glyptostroboides, average of field scores 1.9

Action required according to field scores

Ligustrum lucidum, (OH586), average of field scores 2.9

.....continued

Ligustrum sinensis, (OH585), average of field scores 2.9
Aesculus hippocastanum 'Pumilum', (OH573), average of field scores 2.2
Crataegus missouriensis, (OH602), average of field scores 2.0
Photinia villosa var. *laevis*, (OH606), average of field scores 2.5
Berberis species

Recommendations - urgent

1. Send propagating material of *Chamaecyparis lawsoniana* 'Naberi' (OH662) to Sampsons in New Plymouth and then remove the tree.
2. Remove *Juniperus* 'Meyeri'.
3. Propagate and resite *Crataegus missouriensis* (OH602).
4. Propagate, for eventual re-siting, all other *Crataegus* species.
5. Propagate the unknown *Picea* (OH682).
6. Propagate all *Berberis* in anticipation of eventual removal. (This action has already been taken.)

Recommendations 0-5 years.

1. Remove *Ligustrum lucidum* (OH586), *Ligustrum sinensis* (OH585), and seedling *Gleditsia*.
2. Propagate *Ligustrum confusum* (OH592), and then remove when new material is established.
3. Propagate and resite *Aesculus hippocastanum* 'Pumilum' (OH573), and *Photinia villosa* var. *laevis* (OH606).
4. Repair weak crotch on *Gleditsia triacanthos* (OH595).
5. Take action over *Metasequoia glyptostroboides*.
6. Remove *Berberis* and *Crataegus* when new material is established.
7. Undertake arboricultural work on *Betula platyphylla* var. *japonica* (OH677), to improve structure.
8. Remove the Ginkgo.

Between the tracks - lower portion (See area E)

Urgent action required according to field scores

Dichotomanthes tristaniicarpa, (OH647), average of field scores 1.8
Fagus grandifolia, (OH567), average of field scores 1.9
Emmenopterys henryi, average of field scores 1.3

Action required according to field scores

Prunus serrulata 'Hisakura', (OH683), average of field scores 2.1
Fagus lucida, (OH570), average of field scores 2.7
Azara integrifolia, (OH650), average of field scores 2.5
Prunus campanulata Formosa form, (OH559), average of field scores 2.4

Recommendations - urgent

1. Propagate *Dichotomanthes tristaniicarpa* (OH647), *Fagus grandifolia* (OH567), *Fagus lucida* (OH570), *Prunus campanulata* 'Formosa form' (OH559), *Azara integrifolia* (OH650).
2. Remove *Emmenopterys henryi*.

.....continued

Recommendations 0-5 years

1. Re-site new material of those propagated in 1 above.
2. Propagate *Acer henryi* (OH556), to generate another female plant at the arboretum.
3. Monitor the state of *Acer henryi* as its health rating falls below the acceptable limit.
4. Remove *Prunus serrulata* 'Hisakura' (OH683), as it scores below the agreed limit.
5. Investigate the possible removal of *Magnolia kobus* (OH649), as it rates below the acceptable limit for both 'example of species', and 'contribution to scene'.

Comments

A number of issues were raised in relation to this area and the following area. Comments applying to both are included after the next section.

Between the tracks upper (See area F)

Urgent action required according to field scores

- Prunus campanulata* 'Plena', (OH546), average of field scores 1.4
- Malus* 'Gibbs Golden Gem', (OH524), average of field scores 1.9
- Arbutus unedo*, (OH506), average of field scores 1.7
- Prunus subhirtella* 'Fukubana', (OH508), average of field scores 0.7
- Prunus subhirtella* 'Ascendens', (OH513), average of field scores 1.8
- Parasyringa sempervirens*, (OH542), average of field scores 1.9

Action required according to field scores

- Malus spectabilis* 'Flore Plena', (OH523), average of field scores 2.3
- Malus* 'Red Tip', (OH522), average of field scores 2.0
- Malus glaucescens*, (OH519), average of field scores 2.1
- Malus soulardii*, (OH517), average of field scores 2.7
- Malus prunifolia* 'Fastigiata', (OH518), average of field scores 2.0
- Ligustrum sinensis*, (OH651), average of field scores 2.5
- Prunus yedoensis hybrid*, (OH511), average of field scores 2.5
- Prunus serrulata* 'Asano', (OH507), average of field scores 2.6
- Prunus dulcis* 'IXL', (OH521), average of field scores 2.1
- Olea verrucosa*, (OH537), average of field scores 2.7
- Prunus dulcis* 'Monovale', (OH525), average of field scores 2.1
- Prunus serrulata* 'Kanzan', (OH527), average of field scores 2.2
- Philadelphus pubescens*, (OH548), average of field scores 2.9
- Olea europaea*, (OH657), average of field scores 2.0
- Philadelphus*, (OH656), average of field scores 2.0

Recommendations - urgent

1. Propagate *Prunus campanulata* 'Plena', *Parasyringa sempervirens*, *Malus* 'Gibbs Golden Gem', *Prunus subhirtella* 'Fukubana'. Hold for possible replanting.

.....continued

- | |
|---|
| <ol style="list-style-type: none"> 2. Propagate all other <i>Malus</i> and <i>Prunus</i> listed above for action or urgent action. 3. Propagate for re-siting, both <i>Philadelphus</i>. 4. Remove <i>Arbutus unedo</i>, <i>Prunus subhirtella 'Ascendens'</i>, <i>Ligustrum sinensis</i> (OH651). <p>Recommendations 0-5 years.</p> <ol style="list-style-type: none"> 1. Propagate, or obtain new stock of, those plants which while not below the acceptable average score at present, do have one field rating below 3.0. This includes <i>Prunus subhirtella 'Pendula'</i>, <i>Prunus x juddii</i>, and <i>Crataegus</i> OH543. 2. The committee should undertake a reselection of <i>Prunus</i> and <i>Malus</i> species to generate an approved list of these genera to be used on Orchard Hill. 3. The approved list should be used to generate a replanting plan for <i>Prunus</i> and <i>Malus</i>. 4. Gradually remove selected old <i>Prunus</i> and <i>Malus</i> specimens, and replant with newly chosen material according to the approved list . |
|---|

Recommendation: That the plan of action for Orchard Hill, outlined in table 4.5.2 be implemented.

4.6 Park evaluation - discussion

Some discussion ensued on the way in which Orchard Hill should be treated. The two areas between the tracks, which contain a large body of *Prunus* and *Malus*, were the focus of this discussion.

On the visual qualities of the Hill it was agreed that spring blossom is most important to the character of the park. Although many of the existing trees must be removed because they are at the end of their life, it is important that this element be returned. Generally the Hill is a high impact viewing area, especially from the main lawn, and this should be taken to its full potential. Mr Clapperton suggested that the park had both spring blossom and autumn colour highlights.

On the composition of this part of the Hill the following points were raised. It was agreed that the *Malus* and *Prunus* were most important to the flowering composition. Mr Cave and Mr McKean favoured a trend towards more *Magnolia* planting because 1) this moves towards Douglas Cook's objective of a *Magnolia* area, and 2) while *Malus* are attractive in flower, they are not particularly aesthetic when not in flower, *Magnolia* is a superior genus in this regard. Mr Sykes suggested that the *P.serrulata* cultivars were of low importance to the hill, and that generally they should be removed and the flowering character be replaced with something else.

It was generally agreed that a major clean-up is required through the *Malus* and *Prunus* genera on Orchard Hill. The species of these genera should then be reselected to achieve best results for both the botanical aspects of the collection and its visual impact in this park.

It was also agreed that once the clean-up and reselection process is complete, that a slightly different planting arrangement should be made. At present permanent elements tend to be at the top of the Hill, with transitory elements lower down. Similarly those of high visual impact tend to be on the lower portion, with few highlights amongst the evergreen belt higher up. The effect of this situation is that Orchard Hill has two distinct bands, one evergreen and permanent, the other deciduous and transitory. Ideally this situation needs to be rectified in the long term development of the park. Therefore, when replanting of *Prunus*, *Malus* and

Magnolia is done these elements should be interlaced into the plantings high on the Hill as well as moving further down the Hill. Thus both autumn colour and spring blossom highlights will occur more evenly over the whole of the vista.

Recommendation: That the general identity of Orchard Hill should be retained, i.e. Spring blossom featuring *Malus*, *Prunus*, and *Magnolia*, with coniferous background of *Picea*, *Abies* and *Pinus*.

Recommendation: That after recommended trees have been removed from the park a reconsideration of the plantings should be done.

Recommendation: That the renovated planting scheme should feature: (i) spring display and autumn colour highlights, (ii) a range of high impact *Prunus* and *Malus* types, (iii) *Prunus* types that tend towards species rather than cultivars.

Recommendation: That a proposal for the reselected *Prunus* and *Malus* species be brought to the committee at its next meeting for consideration.

4.7 Conclusion

The key problems on Orchard Hill are those associated with the *Prunus* and *Malus* types on the Hill, and their present degeneration due to old age. Associated with this is the need to better organise the permanent and transitory elements of the Hill, and to improve the visual effect of the display plantings by blending these further up the Hill.

The recommendations in this report call for the removal of the least important and poorest quality plants, and a major reconsideration of the arrangement of transitory plantings on the Hill. Subsequent workshops will deliberate on the proposed new plant list for these plantings, and the arrangement thereof.

Summary of recommendations

That the development of Orchard Hill should follow the themes outlined in section 4.3.

That the plan of action for Orchard Hill, outlined in table 4.5.2 be implemented.

That the general identity of Orchard Hill should be retained, i.e. Spring blossom featuring *Malus*, *Prunus*, and *Magnolia*, with coniferous background of *Picea*, *Abies* and *Pinus*.

That after recommended trees have been removed from the park a reconsideration of the plantings should be done.

That the renovated planting scheme should feature: (i) Spring display and autumn colour highlights, (ii) A range of high impact *Malus* and *Prunus* types, (iii) *Prunus* types should tend towards species rather than cultivars.

That a proposal for the reselected *Prunus* and *Malus* species be brought to the committee for consideration at its next meeting.

SECTION FIVE: Basinhead

5.1 Aim

To resolve management problems at Basinhead. This consideration is subsequent to an initial investigation of this area at the second workshop.

5.2 Background information

Basinhead is a small area within Douglas Park and is on the main thoroughfare when on Douglas Cook walk. It is a small basin with a flat centre surrounded by small ridges and open at the south end. The plantings are set around the perimeter of what was, prior to 1985, a small pond. In 1985 a severe rainstorm set in motion a deep slip on the farmland above Basinhead which resulted in the pond being completely filled in, the basin being covered in 1-2m of clay and several trees being surrounded by slip debris. A number of trees died as a result of this inundation. This, and the loss of the pond, have reduced the visual appeal of the area making improvement necessary. {Readers of this thesis are referred to plan 6 of thesis Appendix Two for a map of the area.}

At the second workshop an initial examination of this area was made. At this time important features of the area were identified and a number of ideas for the renovation of the area were put forward. The important features identified were:

1. An important physical feature was the ridge on the western side that separates Basinhead from the adjacent area. This is an open slope with scattered *Eucalyptus leucoxylon* 'Rosea'. This piece of ground was considered very visually appealing and should be enhanced.
2. A example of *Pinus durangensis* at the lower end of Basinhead is an important specimen tree {Later identified as *P. montezumae*}. Equally, the specimen of *Populus deltoides* 'Carolin' at the upper end of Basinhead is an important example.
3. Other plantings of note include a fine white trunked birch, (species unknown), several blue atlas cedar, *Acer macrophyllum*, and a bunya pine which is recovering from top loss. A series of poplars, (identity not confirmed), run along the fence line at the back of Basinhead.
4. A number of more transitory elements are included in the planting. There are some *Prunus*, (plums peaches and cherries), and a selection of lilacs.

The ideas put forward at the second workshop for renovation of Basinhead were:

1. With respect to the sloping ridge with the *Eucalyptus*:
 - Leave the area alone but remove the poorer trees.
 - Underplant with shrubby material.
 - Install a low planting across the lower slope, and remove the poorer trees.
 - Enhance the ridge top by selectively pruning up the douglas fir, thereby emphasizing the smooth ridge top.
2. With respect to the basin itself:
 - The area is important as an open space, of which there are few in this part of the Arboretum.
 - The margins of the basin appear suitable for mollis azaleas, a planting of azalea about the margin of the basin would enhance the spring display.
 - The central grassy area should be smoothed off.

3. With respect to the view through the basin to the farmland beyond:

- The fenceline across the rear of Basinhead should be planted with small material in order to hide the fence, but allow for the view into the hillside beyond.

4. With respect to plant material:

- *Populus deltoides* ‘Carolin’ should be pruned of broken branches, but otherwise be left as is.
- The various flowering plum cultivars be removed, along with the dying conifers, to give a better view of the poplar.
- The planting along the Pepper flat side of the basin be rearranged in order to take better advantage of microclimate. At present many smaller plants are heavily overshadowed by larger plants along the side of the track, relocating the smaller plants into the edge of the basin (rather than along the track) would ensure better growth and display.
- The yellow plum be removed.
- The cherries along the track should be repropagated

It was agreed at the second workshop that a full assessment of the area should be carried out. The results of this assessment should be used in combination with the ideas outlined above to resolve development issues for Basinhead.

Botanical and aesthetic assessment of the plants in Basinhead can be found in Appendix Tables 5.2-5.4. The most botanically important species was *Zelkova cretica*, with *Acer macrophyllum* and *Fraxinus latifolia* also rating highly. Aesthetically, the *Prunus* species were important. *Araucaria bidwillii* was, on average, the most important plant in Basinhead. *Populus deltoides* ‘Carolin’ did not rank for either botanical or aesthetic score. While this is notable given the high visual impact of the tree, it is also notable because the cut-off point for significance was lowered to 6.0, whereas normally it is 7.0. (This was done due to the comparatively low scores for this assessment.)

Permanent and transitory elements were examined. Permanent and transitory elements are as defined in section four for the Orchard Hill exercise. For Basinhead permanent elements were decided to be *Abies*, *Acer*, *Araucaria*, *Cedrus*, *Fraxinus*, *Pinus*, *Quercus*, *Zelkova* (?). Transitory elements were *Alnus*, *Betula*, *Forsythia*, *Populus*, *Prunus*, *Pyrus*, *Syringa*. Using this definition it is now apparent that Basinhead is largely composed of transitory elements. There are a few permanent elements around the edge of the track, but generally these are few in number. The lack of permanent trees is a serious problem in that the area will be rendered practically empty once all the short lived material dies. On the other hand, this very fact, if well planned for, presents a useful opportunity for the renovation of Basinhead.

There is no specific information on Douglas Cook’s intentions for Basinhead. Mr Gordon reported at the second workshop that it was his understanding that this area should be the site of a lilac cultivar collection. This collection was installed, and the remnants of it are still present, however Eastwoodhill is not generally suitable for *Syringa vulgaris* and the specimens have mostly died out. No other information on Basinhead is known.

5.3 Field exercise

Having considered the background information the field exercise was conducted. Each tree was examined for 'health', 'example of species', and 'contribution to scene'. Rating scales for field assessment can be found in Appendix Three.

5.4 Results

The results of the field exercise can be found in table 5.4.1. The recommendations from the field exercise can be found in table 5.4.2. As a general rule it was agreed that it was necessary to provide space for high scoring species. Species that are repeated elsewhere should be given lower priority. Actions are outlined below, according to the field scores given for each plant. Combination of this information, and the suggestions from the second workshop, are discussed in the discussion section.

5.5 Discussion

The results of the field assessment for plants in Basinhead support the ideas put forward in the second workshop in all respects but one. Assessment supports the retention of the *Prunus cerasifera* var. *diversifolia*, rather than its removal as previously suggested. None of the other ideas previously put forward are at variance with the assessment results.

A number of plants within the Basinhead area have been targeted for immediate removal. Others have been tagged for propagation and then removal. Once these actions have been undertaken the rearrangement of the area can be started. It is apparent that the notion of spring display will play an important role in Basinhead. The number of *Prunus* already present in the area, plus the previous comments of the committee on spring display, support this direction. The *Prunus*, and other spring flowering elements are an important inclusion for this area.

In planning the rearrangement of Basinhead it is important that the distribution of permanent elements is carefully considered. Similarly, in the absence of any statement of firm objectives by Douglas Cook, objectives for the development of this area must be clearly elucidated.

5.6 Conclusion

The assessment of the plant material in Basinhead indicates which plants should be either removed or propagated and re-sited in the immediate future. The present arrangement of Basinhead clearly needs renovation, given the high quantity of transitory material, and the difficulties caused by the slip in 1985. A plan for redevelopment should be initiated once the action from this exercise have been carried out.

Recommendation: That the plan of action for Basinhead, as outlined in table 5.4.2, be implemented.

Recommendation: That a plan for the redevelopment of Basinhead, which takes account of the arrangement of permanent and transitory elements, and spring display, be undertaken.

Table 5.4.1: Preliminary and field assessment of plants in Basinhead

Table 5.4.2: Recommendations from field exercise for Basinhead

Recommendations - urgent

1. Propagate, for eventual resiting, *Buddleia alternifolia* (BH1).
 2. *Fraxinus latifolia* (BH6,47,49). Grow seed from the tree to produce rootstock, then graft. Eventually remove. In the meantime prune out dead and dangerous wood to preserve the specimen while waiting for new material to come on.
 3. Propagate, for eventual removal and resiting, *Stachyurus praecox*, *Viburnum 'Bodnant'*, and the three *Forsythia*. These species to be replanted along the lower side of the planting where they will get more sun.
 4. Propagate and remove *Prunus mume 'The Geisha'* (BH24), and *Prunus persica 'Helen Borchers'* (BH31,32).
-continued

Recommendations 0-5 years

1. *Pyrus pashia* (BH15) to be removed.
2. *Pyrus pashia* (BH16) to be reshaped after the removal of BH15.
3. Remove 2nd *Acer buergerianum* (BH45).
4. Reduce the cluster of *Prunus cerasifera var. diversifolia* (BH37), to one plant.
5. Remove *Magnolia kobus* (BH9).
6. *Grevillea robusta* nearest *Araucaria* should be removed to allow more room for the *Araucaria*.
7. Remove *Chamaecyparis pisifera* ‘Plumosa’ (BH20) and *Chamaecyparis pisifera* ‘Squarrosa’ (BH21). Leave *Chamaecyparis pisifera* ‘Squarrosa’ (BH22) until it begins to encroach on the *Araucaria*, and then remove it.
8. Propagate or obtain new stock of *Betula ermannii* (BH41).
9. Remove *Prunus cerasifera* ‘Thundercloud’ (BH50), *Prunus cerasifera* ‘Pissardi’ (BH51), and *Prunus* ‘Bleirana’ (BH54).
10. Propagate *Prunus serrulata* ‘Yedo Zakura’ (BH39).
11. Propagate for eventual removal, all *Syringa* cultivars.
12. Propagate, for eventual re-siting, all *Prunus serrulata* cultivars.

Comments

1. *Prunus serrulata* ‘Mt Fuji’ is in need of action, however its situation should improve with the thinning of the adjacent *Prunus cerasifera var. diversifolia*.
2. Discussion was held on the possible removal of one or two of the *Cedrus atlantica f. glauca* in favour of the poplar at the back. Consensus was not reached. Field scores show all three *Cedrus* to have a total that is ‘okay’ and requires no action.
3. Discussion was held on the removal of all the *Prunus* except the *P.serrulata* types. This has only been recommended where the field ratings required some action to be taken.
4. *Syringa* cultivars were generally not rated by participants in the field exercise. The recommendation above is based on the increasing age of the plants in question.
5. The *Acer negundo* form, (BH5), is a three foliate form that is not typical. The type exists in two other trees at the Arboretum, neither of which is healthy. The strain should be retained through one of the other trees, or by propagation.

SECTION SIX: Conclusions

At the end of the workshop a concluding discussion was held. The business of the workshop over the previous two days was reconfirmed. Two other matters were raised.

6.1 Information

It was agreed that where a workshop member provided information relevant to the functioning of the workshop, it should be included in the official documents.

6.2 Next workshop

It was agreed that the next workshop should be timed so that decisions made could be implemented that season. It was proposed that the meeting be regularly held in March of any one year. The possibility of a second meeting should be considered. The fourth workshop should comprise one day on the development of the new area, and one day on the review of a park and/or genus. Specific issues that should be raised at the fourth workshop are:

- Cabin Park, Black Forest.
- A genus study, probably *Quercus*.
- Orchard Hill proposals for *Malus* and *Prunus* reselection.
- Basinhead proposals for new concepts
- New area, deliberations on initial concepts as proposed by the subgroup working on this issue.

Recommendation: That the fourth workshop be held in March 1992.

Recommendation: That the fourth workshop address issues such as suggested in section 6.2.

APPENDIX ONE: Programme

Programme for the third Eastwoodhill Arboretum workshop

To be held at Eastwoodhill on 16-17 March 1991

Saturday 16 March

8.30am	Welcome
8.45-9.45	Introduction and review Issues from previous reports Progress reports Update on Gondwana
10.15-12.15	Key genus study - Acer Introduction Field exercise
1.15-2.15	Key genus study - Acer Discussion and conclusion
2.45-5.00	New developments - new area
5.00	Viewing of Douglas Cook Centre for Education

Sunday 17 March

8.30-10.30	Park Management - Orchard Hill Introduction Field exercise
11.30-12.30	Park Management - Orchard Hill Discussion
1.30-2.30	Basinhead exercise
2.30-3.30	Black Forest walk
3.30-4.30	Issues and conclusions

APPENDIX TWO: Tables referred to in the text

SECTION THREE: NEW AREA**Table 3.1: Statements of intent for Eastwoodhill extracted from the writing of William Douglas Cook**

“During the war I stayed in several beautiful country homes in Britain and this left me with a growing desire to create something worthwhile in New Zealand” (Cook, 1948).

“I loved the country scene in England and its beautiful parks and wondered how far I could get in the creation of a park in one lifetime. I determined to make a start” (Cook, 1949).

“Eastwoodhill is very young but has made a good start and my ambition is to grow every worthwhile tree and shrub which will grow in our conditions” (Cook, 1949).

“Our work goes to make New Zealand more beautiful and future New Zealanders’ happier. I’m not working for myself - I’m working for my country and its people whom I love” (Cook, 1963).

“I’d got the idea after staying with wealthy relatives and their friends that I too could have lovely surroundings even if I could never have a fine home and live as they did. That was the start of the park” (Cook, 1963).

“I first got everything the New Zealand catalogues had to offer and then searched England for new material” (Cook, undated b).

“We hope in the near future to be growing at Eastwoodhill practically every tree and shrub available in Britain” (Cook, 1949).

“Very large numbers of Acers are doing well here and also a great many species and varieties of Aesculus, Betula, Fagus, Fraxinus, Buddleia, Euonymus, Juniperus, Larix, Nothofagus and many other genera. We hope shortly to be growing almost all that is available in Britain in trees and shrubs and in such things as Camellias a very large collection, which you do not grow” (Cook, 1949).

“I insist that it is an arboretum pure and simple, and a sanctuary for quiet living people and birds” (Cook, 1964b).

“I’ve suffered all the setbacks any man could. Poor food living alone, depression through lack of money and at times through ill health through worry. I’ve never squandered money but I’ve always been in debt. I always felt I had lots of security if not money and the family motto being “Forward”. I’ve always gone forward - I’d never let it done. If to be poor is to prove oneself a failure then I’ve failed but I’ve left a heritage behind me for future generations of New Zealanders’ to enjoy” (Cook, 1963).

Table 3.2 Objectives for Eastwoodhill as proposed at the first workshop

{In the third workshop report the relevant statements were extracted from the first workshop report and repeated in Table 3.2. The reader of this thesis can refer to the report of Workshop One.}

Table 3.4 Elements bordering the new area

Three Kings	Conifer backdrop with deciduous mix in front.
Orchard Hill	Conifer ridgeline, <i>Chamaecyparis lawsoniana</i> .
Outlook	Conifers with flowering gums, <i>Pinus pinea</i> , <i>Cupressus macrocarpa</i> , <i>Pinus</i> species, <i>Pinus patula</i> , <i>Eucalyptus leucoxylon</i> .
Blackwater	<i>Chamaecyparis lawsoniana</i> and mixed deciduous material
Oregon Flat	Conifers, douglas fir and lawson cypress
Pepper Flat	Conifers, lawson cypress
Basinhead	Poplars along existing fenceline, then douglas fir
China Corner	Taxodium, some pine, some deciduous, then <i>Cedrus deodara</i> and <i>Cedrus atlantica</i> below the tank.
Cook's Corner	The upper portion of Cooks corner which borders the new area is largely open with very little planting
Mexico Corner	Young planting, mixed deciduous.

Table 3.5 Proportion of each key genus represented at Eastwoodhill

Genus	No. of species at Eastwoodhill	Number in genus	Proportion represented	Concentrated plantings
<i>Acer</i>	77	150	51%	
<i>Aesculus</i>	16	13	most?	Circus, Pear Park
<i>Alnus</i>	24	35	68%	Glen Douglas
<i>Betula</i>	37	60	61%	
<i>Camellia</i>	19	82	23%	
<i>Cedrus</i>	4	4	100%	
<i>Crataegus</i>	29	100-200	13-29%	Pear Park
<i>Cupressus</i>	12	20	60%	
<i>Fagus</i>	5	10	50%	
<i>Fraxinus</i>	27	65	41%	Pear Park
<i>Ilex</i>	16	400	4%	Orchard Hill
<i>Juniperus</i>	22	60	36%	Pear Park
<i>Malus</i>	35	35	most?	
<i>Magnolia</i>	33	80	41%	
<i>Pinus</i>	60	100	60%	Orchard Hill
<i>Populus</i>	1	35	37%	
<i>Prunus</i>	43	430	10%	
<i>Pyrus</i>	6	30	20%	
<i>Quercus</i>	84	450	18%	
<i>Tilia</i>	16	50	32%	Circus, Pear Park

Notes

1. Species only considered for this comparison. Number in genus taken according to Krussman.
2. Figures should be taken as a guide only. The inclusion, or otherwise, of hybrids as species rank may distort some of the figures.

SECTION FOUR: ORCHARD HILL

Table 4.1 Known information on Douglas Cook's objectives for Orchard Hill

Hollies at Eastwoodhill: A manuscript written by Douglas Cook in 1957

"At last we have got round to the planting of our new material. The Southerly and South Easterly slopes of Orchard Hill have been fenced in and the paths, made some years ago, are now consolidated. Many more slips will no doubt occur but they can be cleared by hand. The upper two acres of the hill are extremely steep and what soil there is sits almost on rock. This upper area has been planted mostly in Douglas Fir with a few wattles for winter colour and a couple of dozen scarlet gum (*Eucalyptus ficifolia*) to brighten the dark background in summer. A block of silver birch were planted where the soil was very thin on the rock and just a few Douglas Firs divided them from a small block of perhaps a dozen scarlet oaks (*Q.coccinea*) from seed, then another break of firs and an irregular straggle wherever the soil was a little better.. *Liquidamber styraciflua*..... above a small rock face we have planted *Vitis 'Ailcanthe Bouchet'* to festoon over the rock. On the far dry ridge running north east we had to resort to *Pinus radiata* to cut off the Westerly gales from our lower plantings.

When the steeper slopes were planted we came to a cold ridge facing south which I thought should suit hollies as I had never seen them doing better than in cold situations, so holes were dug 20ft apart and our hollies planted in an inverted V with the blunt end to the view point. There are over 100 species and varieties of holly but we had only 20 to put out, others common in New Zealand being in other parts of the grounds.. *Ilex aquifolium* gave us three. We started with the rather coarse looking *I. 'Camelliaefolia'* with its large glossy dark green almost spineless leaves from 5 inches long by 2 inches wide. It is said to be one of the finest berrying hollies. *I.aquifolium 'Ferox Aurea'* extremely thorny with a yellow centre to the leaf and green spines and edge. *I.aquifolium 'Regina Golden Queen'* has a margin of gold and a green centre to the leaf, but being a male plant not much good for berry. Why not Golden King?. This is said to be the finest of the golden hollies.

I.corallina is an interesting looking species from China with lanceolate wavy spiny leaves and said to bear red berries. It is too new for much to be known about it but it is said to grow 25ft. *I.cornuta* is very old having been found in China by Fortune in 1846 but is a recent arrival in New Zealand. It is an evergreen growing only 8-10ft high and will stand remarkable dryness I find. Its leaves are very plain but have three spines. Its scarlet fruits are not generously borne.

I.dipyrena is the Himalayan holly growing into a 40ft tree with large red berries sparsely borne. It strikes me as being just another evergreen and not by any means a 'must have'. *I.fargesii* is another Chinese evergreen up to 20ft with red berries but I think its long narrow leaves might make it a rather attractive tree. *I.fragilis*, *I.franchettii*, *I.forrestii* and *I.insignis* must be very new judging by their but little can be found about them in books. *I.insignis* comes from the Sikkim Himalayas and is certainly tender here in the young stages. If it likes its new home it should make a handsome tree. *I.latifolia* must be one of the largest growers as it attains a height of 60ft in Japan where it is said to be one of their handsomest evergreens. Its leaves are large but not spiny and its large berries are borne in great numbers. *I.pernyi* is another evergreen with red berries

from western and central China which bids fair claim to our attention in the future as a good evergreen for small gardens.

I.platyphylla var. maderensis is a soft evergreen from Madeira is called *I.perado* in Madeira and has dark red, almost black berries. *I.serrata* hails from Japan, is deciduous, bears quantities of red berries, branches of which are much used in Tokyo for decoration as the berries hang on well. *I.verticillata* was introduced into New Zealand by Stevens of Bulls in 1938. It is another deciduous holly from the eastern states where it is known as the black alder. It grows 6-10ft high but has a spreading habit. It is said to be the most ornamental of deciduous American hollies its glossy scarlet berries being well coloured before the leaves fall. *I.wilsoni* was discovered by Wilson in China but little is yet known about it. It has scarlet berries here. *I.rosmarinifolia* has foliage like rosemary.

In the open centre of the V up the hill was planted three *Prunus campanulata* which with their mid July rich coloured flowers should make a splash against such a sombre background. In front of these quite a large space is left for other genus as this is rather a special view point. It may later go into Magnolias. Next to the hollies a long shallow depression runs down the hill face almost due south and is in full view from the house terrace ten chains away. Here we decided to place our collection of 36 *Abies* leaving the view up the glade open so that each tree can be seen from the distance. Most *Abies* are tall rather than broad but I think even in 50 years time there may still be beauty here for, though a tree grows 150ft high it may not be more than 50ft of that in 50 years and I would expect less of most. The open glade will be left in grass and planted in daffodils.

Abies have not been much planted in New Zealand and less now than formerly because it has been found that so many are subject to bug diseases particularly in the north island. It is for that reason that I have chosen the coldest spot in the garden for them, lying steeply away from the sun and in fair ? (can't read last word). The few which have been commonly offered in New Zealand have, for the most part, been unsatisfactory and those I know are mostly half starved and of little beauty. *Abies pinsapo* in the north island seems happy and healthy and does well in the dry atmosphere at Eastwoodhill. *Picea smithiana* also thrives and makes graceful specimens but *Picea abies* is diseased as are *Picea sitchensis* and *Abies nordmanniana*. Quite probably these would be happier in the cold wet districts of our country as they hail from such climates. *Picea abies* the Norway spruce, *Picea sitchensis* largely from the western coast of Canada and *Abies nordmanniana* from the Caucasus. These we have not bothered with but are trying such things as:” (list follows here)

In summary from this manuscript I propose that the objectives for Orchard Hill were:

- evergreen background with seasonal highlights, (*Prunus campanulata*, *Eucalyptus ficifolia*).
- suitable site for a holly collection.
- the most suitable site on the arboretum for *Picea* and *Abies*.
- pine collection forming part of evergreen background.
- potential site for *Magnolia*.

Table 4.3 Ranking of plants on Orchard Hill according to Average score

Table 4.6: Arboretum key genera in Orchard Hill

Key genus	Present	Number of species and cultivars on OH	Number of species and cultivars on OH as % of number of species and cultivars at Eastwoodhill	Are the plants sole examples
<i>Acer</i>	Yes	5	3%	Yes
<i>Aesculus</i>	Yes	1	4%	Yes
<i>Alnus</i>	No	0	-	
<i>Betula</i>	Yes	1	2%	Yes
<i>Camellia</i>	No	0	-	
<i>Cedrus</i>	No	0	-	
<i>Crataegus</i>	Yes	5	13%	Yes
<i>Cupressus</i>	Yes	2	11%	Yes
<i>Fagus</i>	Yes	3	17%	Yes
<i>Fraxinus</i>	No	0	-	
<i>Ilex</i>	Yes	11	47%	Yes
<i>Juniperus</i>	Yes	4	13%	No
<i>Magnolia</i>	Yes	8	13%	Yes
<i>Malus</i>	Yes	8	13%	Yes
<i>Pinus</i>	Yes	17	28%	Yes
<i>Populus</i>	Yes	1	3%	No
<i>Prunus</i>	Yes	21	19%	Yes
<i>Pyrus</i>	No	0	-	
<i>Quercus</i>	Yes	5	5%	Yes
<i>Tilia</i>	No	0	-	

In terms of number represented the most important key genera are *Prunus*, *Pinus* *Ilex*. In terms of percentage representation the most important key genera are, *Ilex*, *Pinus*, *Prunus*, *Fagus*, *Juniperus*, *Magnolia*, *Malus*, *Crataegus*.

Table 4.7: Park key genera for Orchard Hill

Genus	Average score	No. of species and cultivars on OH (N)	N as a percentage of number of species and cultivars of that genus in current collection	Are the plants sole examples?
<i>Abies</i>	8.20	14	37%	Yes
<i>Berberis</i>	6.40	8	42%	Yes
<i>Picea</i>	7.89	10	35%	Yes

In terms of number the most important genera (arboretum and park) are, *Prunus* 21, *Pinus* 17, *Abies* 14, *Ilex* 11, *Picea* 10, *Magnolia* 8, *Malus* 8, *Berberis* 8.

In terms of percentage the most important genera (arboretum and park) are: *Ilex* 47%, *Berberis* 42%, *Abies* 37%, *Picea* 35%, *Pinus* 28%, *Prunus* 19%, *Fagus* 17%.

Picea group
Taxodium distichum
Carya pecan
Picea breweriana

Abies group
Abies kawakamii
Abies squamata
Abies concolor 'Compacta'
Abies lasiocarpa var. *arizonica*
Abies recurvata
Picea pungens 'Moerheimii'
Abies sutchuenensis alpine form
Abies koreana
Abies forrestii
Abies nobilis 'Glauca'
A. balsamea -dead
Abies grandis
Abies lasiocarpa
Abies gamblei

Holly group
Ilex forrestii
Ilex species Yu
Ilex wilsoni

Table 4.9: Genera on Orchard Hill, taking into account previous plantings

Genus	Currently existing	Previously existing	Current number on OH	Previous number on OH	% survival
<i>Abies</i>	Yes	Yes	14	14+12=26	53
<i>Acer</i>	Yes	Yes	5	5+9=14	35
<i>Aesculus</i>	Yes	Yes	1	1	100
<i>Alnus</i>	No	Yes	0	1	0
<i>Berberis</i>	Yes	Yes	8	?	
<i>Betula</i>	Yes	Yes	1	1+3=4	25
<i>Camellia</i>	No	No	-	-	-
<i>Cedrus</i>	No	Yes	0	1	0
<i>Crataegus</i>	Yes	Yes	5	5	100
<i>Cupressus</i>	Yes	Yes	2	2	100
<i>Euonymus</i>	Yes	Yes	1	1+5=6	16
<i>Fagus</i>	Yes	Yes	3	3+1=4	75
<i>Fraxinus</i>	Yes	Yes	1	1	100
<i>Ilex</i>	Yes	Yes	11	11	100
<i>Juniperus</i>	Yes	Yes	4	4	100
<i>Magnolia</i>	Yes	Yes	8	8+11=19	42
<i>Malus</i>	Yes	Yes	8	8+3=11	72
<i>Picea</i>	Yes	Yes	10	10+1=11	90
<i>Pinus</i>	Yes	Yes	17	17+2=19	89
<i>Populus</i>	Yes	Yes	1	?	
<i>Prunus</i>	Yes	Yes	21	21+9=30	70
<i>Pyrus</i>	No	Yes	0	-	
<i>Quercus</i>	Yes	Yes	5	5+1=6	83
<i>Tilia</i>	No	No	0	-	

Notes.

1. This table does not include the birch belt.
2. *Prunus* results are debatable due to the number of unidentified *Prunus*.

In terms of number the most important genera are,

Present: *Prunus* 21, *Pinus* 17, *Abies* 14, *Ilex* 11, *Picea* 10, *Magnolia* 8, *Malus* 8, *Berberis* 8,

Previous: *Prunus* 30, *Abies* 26, *Magnolia* 19, *Pinus* 19, *Acer* 14, *Picea* 11, *Ilex* 11, *Malus* 11,

In terms of percentage survival the most successful of these genera are:

Ilex 100%, *Picea* 90%, *Pinus* 89%, *Malus* 72%, *Prunus* 70%, *Abies* 53%, *Magnolia* 42%, *Acer* 35%

It is notable that *Euonymus* survived poorly while *Crataegus* did well even though both could be classed as short lived groups.

Table 4.10: Actual heights and expected heights of tree on Orchard Hill

Plant	Reference number	Botanical score	Aesthetic score	Actual height	Expected height	Height index
<i>Abelia grandiflora</i>		5.2	9.0	3.7m	1.5-3m	4.5

Table 5.5: Plants previously found in Basinhead

Start from bottom point, anticlockwise, just below track.	<i>Magnolia watsonii</i> <i>Prunus sanguinea 'Plena'</i> <i>Magnolia campbellii</i> <i>Prunus mume 'Charles Abraham'</i>
<i>Telopea oreades</i>	
<i>Prunus tenella</i>	
<i>Prostanthera rotundifolia</i>	
<i>Pomaderris elliptica</i>	
<i>Cercis chinensis</i>	
 Start from bottom point, anticlockwise, along edge of old pond	 Road on west side (can't tell if above or below the track)
<i>Magnolia soulangeana 'Alexandrina'</i>	<i>Stewartia pseudocamellia</i>
<i>Stewartia ovata</i>	<i>Melia azedarach</i>
<i>Magnolia soulangeana 'Lennei'</i>	<i>Acer japonicum</i>
<i>Prunus 'Pink Perfection'</i>	<i>Paulownia tomentosa</i>
<i>Chimonanthus fragrans</i>	<i>Magnolia loebneri</i>
<i>Malus coronaria</i>	<i>Magnolia soulangiana 'Lennei'</i>
<i>Prunus 'Takasago'</i>	<i>Magnolia soulangiana 'Alexandrina'</i>
<i>Magnolia sieboldii</i>	 Pepper flat
<i>Magnolia campbellii f. alba</i>	<i>Calliandra portoricensis</i>
<i>Neillia opulifolia</i>	<i>Cedronella triphylla</i>
<i>Magnolia soulangeana 'Rustica Rubra'</i>	<i>Schinus dependens</i>
<i>Magnolia sinensis</i>	
<i>Buddleia colvillei</i>	
<i>Magnolia sargentiana var. robusta</i>	
<i>Alnus arguta</i>	
<i>Magnolia campbellii</i>	
<i>Magnolia sprengeri var. diva</i>	
 From pepper flat junction, anticlockwise, below track	
<i>Prunus persica 'Rose Brilliant'</i>	
<i>Magnolia delavayi</i>	
<i>Prunus cerasifera 'Nigra'</i>	
<i>Prunus cerasifera 'Thundercloud'</i>	
<i>Prunus 'Pollardi'</i>	
<i>Magnolia sinensis</i>	
<i>Prunus 'Pink Cloud'</i>	
<i>Populus lasiocarpa</i>	
<i>Prunus persica 'Iceberg'</i>	
<i>Prunus 'Rose Brilliant'</i>	
<i>Prunus cerasoides</i>	
 Near the existing Grevillea robusta	
<i>Magnolia sieboldii</i>	

APPENDIX: Rating scales used in field exercises**HEALTH**

- 1 Unlikely to survive
- 2 Alive, poorly furnished, signs of stress, dying back
- 3 Fully furnished, signs of stress, not growing
- 4 Well furnished, healthy, no stress signs, growing slowly.
- 5 Well furnished, healthy, no stress signs, growing vigorously, .

AS AN EXAMPLE OF THE SPECIES

- 1 Not representative of the species, all factors unsatisfactory
- 2 Poor example of the species, three factors unsatisfactory
- 3 Identifiable example of the species, two factors unsatisfactory.
- 4 Good example of the species, only one factor unsatisfactory
- 5 Excellent, all factors good.

Factors: health, association with other trees, form (shape), form (structure).

GROWTH PHASE

- 1 Senescent - not growing, declining canopy.
- 2 Mature - adult features, growth regenerative
- 3 Immature vigorous - adult features, growth vigorous
- 4 Juvenile vigorous - established, in rapid growth, juvenile features
- 5 Establishment - Plant still establishing, not yet growing

CONTRIBUTION TO SCENE

1. Insignificant tree in this scene
2. Noticeable tree, but part of the general canopy.
3. Average visual impact on the area, tree stands out as an individual
4. Major contributor to this scene
5. Dominant feature of the area.

HEIGHT INDEX

- 0.5 Has made less than 10% of expected height
- 1.0 Has made about 20% of expected height
- 1.5 Has made about 40% of expected height
- 2.0 Has made about 60% of expected height
- 2.5 Has made about 80% of expected height
- 3.0 Is in expected height range
- 3.5 Has grown 30% more than expected height
- 4.0 Has grown 50% more than expected height
- 4.5 Has grown 80% more than expected height
- 5.0 Has grown 100% or more than expected height

APPENDIX: List of participants

Participants in the third workshop

Mr Bob Berry, Plantsman and Farmer, Hackfalls Arboretum, Gisborne.

Mr Spencer Bush, Arboretum Supervisor, Gisborne.

Mr Peter Cave, Nurseryman, Cambridge.

Professor David Chalmers, Deputy Vice Chancellor, Charles Sturt University, Wagga Wagga, Australia.

Mr Garry Clapperton, Curator, Eastwoodhill.

Mr Gordon Collier, Consultant and Plantsman, Taihape.

Mr Rodney Faulkner, Farmer and Arboretum Trust Board, Gisborne.

Mr Ron Gordon, Farmer and Plantsman, Taihape. (Surveys only)

Mr Michael Hudson, Plantsman and Farmer, Hawkes Bay.

Mr Allan Jellyman, Community Services Director, New Plymouth.

Mrs Marion MacKay, Department of Horticultural Science, Massey University.

Mr Ian McKean, Farmer and Plantsman, Rangiwahea.

Mr Paul Pollock, Nurseryman and Arboretum Trust Board, Gisborne.

Dr W R Sykes, Botanist, D.S.I.R. Land Resources Division, Christchurch.

Appendix 8

Collection assessment data

Euonymus grandiflorus f. salicifolius, Pear Park, May 1987.

Collection assessment data

Codes for each column

1. For botanical, aesthetic and average scores. No. is the number of observations that contributed to each score. Score is the mean of the observations on a scale from 1-10. These scores were done for the current collection only. Genera in the current collection that were not included in the scoring exercise at the time, and have no data, are marked '-'.
2. Cat. indicates whether the genus is a tree, shrub or climber genus. T=tree, C=climber, S=shrub, SI=intermediate between tree and shrub.
3. Current, previous and total collections. S+C=N. Species + Cultivars = Number of representatives of that genus at Eastwoodhill. The total collection = current collection + previous collection.

Genus	Botanical score		Aesthetic score		Average score		Cat.	Current collection S+C=N	Previous collection S+C=N	Total collection S+C=N
	No.	Score	No.	Score	No.	Score
