NON-NATIVE PLANT INVASIVENESS RANKING FORM

B. INVASIVENESS RANKING

1. ECOLOGICAL IMPACT

1. ECOLOGICAL IMI ACI			
regime,	pact on Natural Ecosystem Processes and System-Wide Parameters (e.g. fire geomorphological changes (erosion, sedimentation rates), hydrologic regime, and mineral dynamics, light availability, salinity, pH) No perceivable impact on ecosystem processes based on research studies, or the absence of impact information if a species is widespread (>10 occurrences in minimally managed areas), has been well-studied (>10 reports/publications), and has been present in the northeast for >100 years.	0	
B.	Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability)	3	
C.	Significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, reduces open water that are important to waterfowl)	7	
D.	Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology and/or hydrology, affects fire frequency, alters soil pH, or fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)	10	
U.	Unknown		
	Score	3	
	Documentation: Identify ecosystem processes impacted (or if applicable, justify choosing answer A in the		
	absence of impact information)		
	Species climbs on other vegetations probably limiting light availability for the plants it is growing on. Martine (in Martine et al., 2008) reported on the plant's ability to easily overtake adjacent plantings in planted sites. No evidence of significant alteration or disruption of ecosystem processes. The plant has been seen on roadsides and in old fields; it has not been noted in less disturbed natural ecosystems. Sources of information:		
	Martine et al., 2008; author's (Moore's) personal observations.		
1.2. Imp	pact on Natural Community Structure		
Α.	No perceived impact; establishes in an existing layer without influencing its structure	0	
B.	Influences structure in one layer (e.g., changes the density of one layer)	3	
C.	Significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer)	7	
D.	Major alteration of structure (e.g., covers canopy, eradicating most or all layers below)	10	
U.	Unknown		
	Score	3	
	Documentation:		
	Identify type of impact or alteration: Species clearly changes the density in the layers in which it is growing. No evidence, however that it creates or eliminates new layers. Sources of information: Martine et al., 2008; author's (Moore's) personal observations.		
1.3. Imp	pact on Natural Community Composition		
A.	No perceived impact; causes no apparent change in native populations	0	
B.	Influences community composition (e.g., reduces the number of individuals in one or more native species in the community)	3	
C.	Significantly alters community composition (e.g., produces a significant reduction in the population size of one or more native species in the community)	7	
D.	Causes major alteration in community composition (e.g., results in the extirpation of one or several native species, reducing biodiversity or change the community composition towards	10	

U.	species exotic to the natural community) Unknown		
0.		Score	3
	Documentation: Identify type of impact or alteration: Reported by Martine (in Martine et al., 2008) to be fast-growing with the potential to smother native vegetation. However, this conclusion is based on planted material. Observations in field by author indicate that the species does indeed outcompete native species in the areas where it grows but no evidence available for significant reductions native plant populations. Species has been in cultivation for at least sixty years. Sources of information: Martine et al., 2008; author's (Moore's) personal observations.		
the anir Exampl connect soil/sed native s	pact on other species or species groups (cumulative impact of this species mals, fungi, microbes, and other organisms in the community it invades. les include reduction in nesting/foraging sites; reduction in habitat tivity; injurious components such as spines, thorns, burrs, toxins; suppress timent microflora; interferes with native pollinators and/or pollination of a species; hybridizes with a native species; hosts a non-native disease which is a native species)	ses 1	
A.	Negligible perceived impact		0
В. С.	Minor impact Moderate impact		3 7
D.	Severe impact on other species or species groups		10
U.	Unknown	,	
		Score	U
	Documentation: Identify type of impact or alteration: Reported to hybridize with Fallopia japonica (Bailey, 2004; Martine et al., 2008) but th hybrid (Fallopia xconollyana) not mentioned in Flora of North America treatment for Fallopia (Freeman & Hinds, 2005). Not clear how to assess the species' potential to hybridize with the highly invasive Fallopia japonica. It might also be possible for this species to hybridize with the native Fallopia scandens. More studies needed to determithe effects of hybridization with other native and non-native Fallopia species. Sources of information: Bailey, 2004; Freeman & Hinds, 2005; Martine et al., 2008.	ne	20

3. ECOLOGICAL AMPLITUDE AND DISTRIBUTION

3.1. Density of stands in natural areas in the northeastern USA and eastern Canada (use same definition as Gleason & Cronquist which is: "The part of the United States covered extends from the Atlantic Ocean west to the western boundaries of Minnesota, Iowa, northern Missouri, and southern Illinois, south to the southern boundaries of Virginia, Kentucky, and Illinois, and south to the Missouri River in Missouri. In Canada the area covered includes Nova Scotia, Prince Edward Island,

New Brunswick, and parts of Quebec and Ontario lying south of the 47th parallel of latitude") No large stands (no areas greater than 1/4 acre or 1000 square meters) A. 0 Large dense stands present in areas with numerous invasive species already present or B. 2 disturbed landscapes Large dense stands present in areas with few other invasive species present (i.e. ability to 4 invade relatively pristine natural areas) Unknown U. Score 0 Documentation: Identify reason for selection, or evidence of weedy history: No stands noted of over one quarter acre in the area; author's limited experience with it is a single (or possibly a few) clustered vines which while exhibiting smothering growth have not been shown to form large (i.e., over 0.25 acres) dense stands. Sources of information: Martine et al., 2008; author's peronal observations. 3.2. Number of habitats the species may invade Not known to invade any natural habitats given at A2.3 Α. 0 Known to occur in two or more of the habitats given at A2.3, with at least one a natural B. Known to occur in three or more of the habitats given at A2.3, with at least two a natural C. Known to occur in four or more of the habitats given at A2.3, with at least three a natural 4 D habitat. Known to occur in more than four of the habitats given at A2.3, with at least four a natural E. 6 habitat. Unknown U. Score Documentation: Identify type of habitats where it occurs and degree/type of impacts: See A23 Sources of information: Flora of North America Editorial Committee, 2005 3.3. Role of disturbance in establishment Requires anthropogenic disturbances to establish. Α 0 May occasionally establish in undisturbed areas but can readily establish in areas with В natural or anthropogenic disturbances. Can establish independent of any known natural or anthropogenic disturbances. \mathbf{C} 4 Unknown Score 2 Documentation: Identify type of disturbance: Readily establishes in areas with disturbance, although data are limited. No evidence that it requires anthropogenic disturbance or that it can establish in undistubed areas. . Sources of information: Freeman & Hinds, 2005 3.4. Climate in native range Native range does not include climates similar to New York Α 0 Native range possibly includes climates similar to at least part of New York. В. 1 Native range includes climates similar to those in New York C. 3 Unknown U.

C. STATUS OF CULTIVARS AND HYBRIDS:

At the present time (May 2008) there is no protocol or criteria for assessing the invasiveness of cultivars independent of the species to which they belong. Such a protocol is needed, and individuals with the appropriate expertise should address this issue in the future. Such a protocol will likely require data on cultivar fertility and identification in both experimental and natural settings.

Hybrids (crosses between different parent species) should be assessed individually and separately from the parent species wherever taxonomically possible, since their invasiveness may differ from that of the parent species. An exception should be made if the taxonomy of the species and hybrids are uncertain, and species and hybrids can not be clearly distinguished in the field. In such cases it is not feasible to distinguish species and hybrids, and they can only be assessed as a single unit.

Some cultivars of the species known to be available: 'Acofal', 'Lemon Lace', 'Summer Sunshine'
