Summary

The Living Collection of the Dominion Arboretum

The Dominion Arboretum represents one of the oldest aspects of the plant hardiness research programs of Agriculture and Agri-Food Canada. It is located on the eastern boundary of the Central Experimental Farm (CEF) in Ottawa. See (<http://res2.agr.gc.ca/ecorc/>), (http://www.agr.gc.ca/cef-fec/cef-fec_e.php?section=consultation&page=intro)

The Dominion Arboretum collection comprises approximately 4,000 individual tree and shrub specimens from 56 families. Some families have only a single representative. The largest family is the oleaceae (comprising mainly of the genus *Syringa* - the lilacs) with over 300 varieties, cultivars and hybrids. Some trees and shrubs date from plantings as early as 1889, only 3 years after the CEF itself was founded by William Saunders. Although not presently used in an active science research program, the Arboretum collection annually is enjoyed by an estimated 175,000 visitors who experience its peace and beauty or enjoy recreating on the 26 ha site.

This publication lists an inventory of the living tree and shrub collection. Its primary audiences are other arboreta, botanical gardens or learning institutions which may be interested in this unique Canadian collection.

Introduction

The Dominion Arboretum of Canada at Agriculture and Agri-Food Canada's Central Experimental Farm in Ottawa Ontario Canada is geographically located at 75 degrees 43 minutes longitude, 45 degrees 23 minutes latitude and is 116 meters above sea level. The Arboretum displays a wide range of well established trees and shrubs, some dating back to 1889 when the Arboretum was started. The existing Arboretum covers approximately 26 ha of rolling land between Prince of Wales Drive and the historical Rideau Canal system (see map). The terrain is comprised of various soil types from loam, sandy loam to clay with varying moisture levels. Because the Dominion Arboretum is north of the 45 degree latitude, it is considered to be the most northerly Arboretum on the continent and is especially useful in testing for hardiness of various plant materials.

The climate of the area has a significant bearing on the testing of new plants. Ottawa has a temperate, continental climate with a moderating influence in the winter because of the proximity to the Great Lakes. Large changes in the weather are often experienced from day to day and relatively large temperature changes occur from season to season. The mean annual temperature is 6°C. July is the warmest month, with a mean temperature of 16°C, and January is the coldest month, with a mean temperature of -11°C. During an average year, the normal minimum- maximum temperatures are -16°C in January and 27°C in July. Statistically a temperature of 35°C or above can be expected one day each summer and -32°C or below one day each winter. The largest temperature range in one year at the Central Experimental Farm during the last 62 years occurred in 1943 when the temperature ranged from -36°C in February to 38°C in August. The highest and lowest temperatures ever recorded in Ottawa are 39°C on July 2, 1931 and -39°C on December 29, 1933. Arboretum staff have noticed a moderation of winter temperatures and snow accumulation since 1995. The average dates of the last frost in the spring and the first frost in the fall are May 13 and September 28, respectively; and the average frost free period is 137 days.

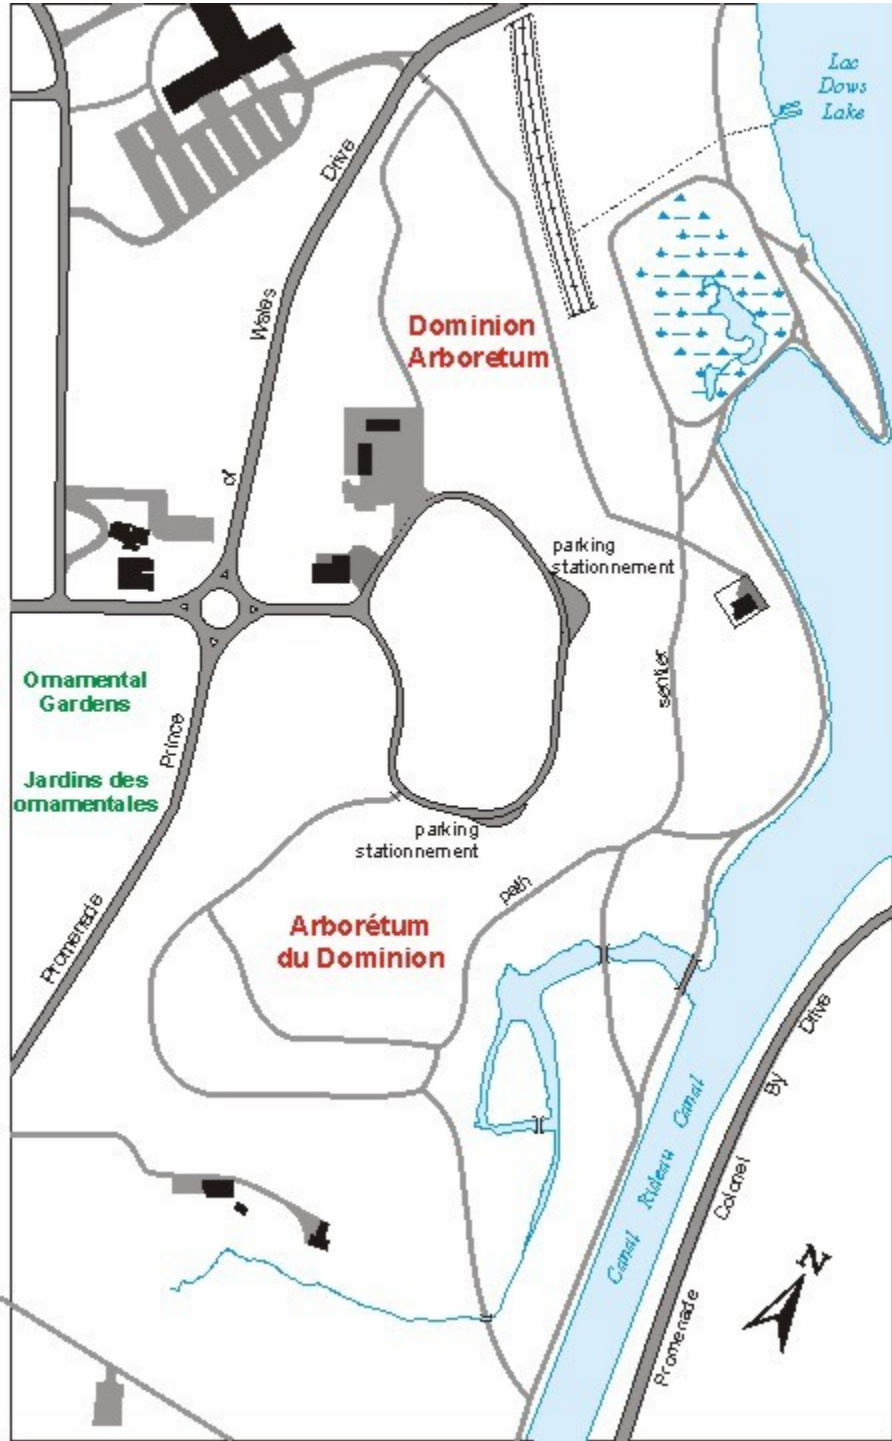

In the early years trees and shrubs of the Arboretum were acquired from the famous nurseries of Spaeth in Germany, Louis Freres in France and Ellwanger and Barry in Rochester, New York, and the Arnold Arboretum in Jamaica Plains, Massachusetts. The collections at the Arboretum are especially rich in such hardy groups as crab apples, junipers, lilacs, maples, spruces and pines. The Arboretum collections contain approximately 4000 individual specimens which consist of 56 families, 157 genus, 570 species, 103 infraspecific, 907 cultivars and 129 hybrids.

The accompanying list represents the current inventory of the living collections of the Dominion Arboretum as maintained on its computerized data base. Maps and other control systems plot the plant locations on the grounds. The collections are constantly being altered through additions, removals or deaccessions. Some taxa not listed in this inventory may actually be represented in the collections, while some species listed may no longer be included.

Representatives of most of the ornamental trees and shrubs growing in the Dominion Arboretum on the Central Experimental Farm also are included in collections of the National Vascular Plant Herbarium. (http://res2.agr.gc.ca/ecorc/dao/index_e.htm)

Mission Statement of the Dominion Arboretum. The mission of the Dominion Arboretum is to preserve and perpetuate its collections in a pleasing and harmonious landscape.

Indexes

Three indexes are provided to allow readers easily to search for trees and/or shrubs of interest.

Availability and Request Form

(A) Availability of propagation material from the living collections of the Dominion Arboretum.

The Arboretum will supply only other Arboreta, botanical gardens or learning institutions with seed from species stock. Because many of the plants are open pollinated the Arboretum cannot guarantee that seed will produce plants true to name.

Seed will be collected depending on seasonal availability. If there is a low or poor supply of seed at the time of collection, the request may be denied. A resubmission the following season will be required.

Submissions will only be accepted by post or email.

See form below.

(B) Request Form

Name.....

Address.....

Requested species.....
