

# Primula Auricula

- There are many different types of Auriculas. Easy to grow, they prefer alpine growing conditions, free-draining soil in a cool, airy spot, out of the midday sun.
- They are often grown in theatres, even makeshift theatres, to give plants the cooler outdoor conditions they like, while still providing some shelter from extreme wet and sunshine.

**Alpine varieties:** shading on the flower is usually darker on the inside becoming lighter towards the outside.
