Smithsonian Institution, Washington, D.C. 20560 U.S.A.

### ABSTRACT

A re-evaluation of *Tillandsia* subgenus *Pseudo-catopsis* (André) Baker revealed sufficiently distinct characters to warrant the establishment of a new genus, *Racinaea*. Named in honor of Racine Foster, *Racinaea* is described and discussed, and new combinations are provided for 46 species and 15 varieties.

KEY WORDS: Bromeliaceae, *Pseudo-catopsis*, *Racinaea*, *Tillandsia*

*Tillandsia* section *Pseudo-catopsis* was established by André in 1889. Shortly thereafter, Baker (1889) elevated *Pseudo-catopsis* to subgeneric rank. He characterized the group by having leaves rosulate, coriaceous, acuminate, and more or less densely lepidote, spikes distichous, flowers small, and a capsule 3-4 times the length of the sepals. Mez (1896), in his treatment of Bromeliaceae for C. DeCandolle's *Monoaraphiae Phanerogamarum*, accepted *Pseudo-catopsis* as a valid subgenus in *Tillandsia*, but did not accept all of Baker's descriptive characters. He redefined it by using both stamens that are shorter than the petals and asymmetric sepals as the relevant subgeneric characters. In doing so, he transferred several species out of subg. *Pseudo-catopsis* sensu Baker and into other subgenera in *Tillandsia*. Smith & Downs (1977) continued the use of *Pseudocatopsis* sensu Mez in their monograph of the Bromeliaceae, though they further defined it as having sepals broadest towards the apex.

During the course of revisionary work on the genera of Bromeliaceae, we have come to the conclusion that taxa treated under subgenus *Pseudocatopsis* are sufficiently distinct from other tillandsioid species to warrant generic segregation. We therefore establish the new genus *Racinaea* to accommodate them. The unique set of characters that readily distinguish *Racinaea* from other tillandsioid genera are distichous, small and inconspicuous flowers;

asymmetric sepals which are broadest towards the apex and free or nearly so; stamens and pistil that are included in the corolla; and a short and stout style. A generic description and appropriate new combinations for taxa previously treated as *Tillandsia* follow. It should be noted that *Tillandsia adpressa* André and its varieties, while belonging in *Racinaea*, are excluded from the present work because they are being treated separately elsewhere (Grant, in press).

The generic name is adopted in honor of the late Racine Foster (1910-1991) who, with her husband Mulford Foster, collected more than 200 new species of bromeliads, founded the Journal of the Bromeliad Society, and authored the book, *Brazil, Orchid of the Tropics*. She was a remarkable woman and her dedication to the study of bromeliads was an exemplary and lifelong endeavor. It gives us great pleasure to name our new genus after her.

**Racinaea** M.A. Spencer & L.B. Smith, *gen. nov.* TYPE: *Tillandsia cuspidata* L.B. Smith, *Phytologia* 9:252, pl. 3, figs. 7-8. 1963.

*Tillandsia* section *Pseudo-Catopsis* André, *Bromel. Andr.* 62, 66. 1889.

*Tillandsia* subgenus *Pseudo-Catopsis* (André) Baker, *Handb. Bromel.* 157, 192. 1889.

Herbae acaules vel caulescentes, epiphytiae. Folia rosulatim subpatentia vel subbulbosa. Vaginae amplae, aequales vel subinflatae. Laminae lingulatae vel subfiliformes. Scapus distinctus. Inflorescentia simplex vel composita, ramis distichis, rarissime leviter secundis. Flores hermaphroditici, actinomorphic, distichi vel raro secundi, sessiles vel brevissime pedicellati, inconspicui, omnibus minutis, saepissime pallidi vel lutescentes. Sepala convoluta, asymmetrica et fere ad apicem latiora, non ultra 15 mm longa, libera vel rarissime basi brevissime coalita. Petala libera, nuda, plus minusve patentia quam sepalis breviora vel longiora. Stamina et pistilla semper inclusa. Filamenta libera, quamquam interdum adnata ad petala. Ovarium optime superius, glaberrimum. Stylus subsessilis vel brevissimus et crassus, ovario brevior. Capsula septicide dehiscentia. Semina erecta, basi pilorum pappiformium sericantiumque seuto niveorum coma appendiculata.

Plants caulescent to short-caulescent, epiphytic. Leaves rosulate, open to subbulbous. Sheaths ample, even to subinflated. Blades ligulate to subfiliform. Scape distinct. Inflorescence simple or compound, branches distichous, rarely secund. Flowers hermaphroditic, actinomorphic, distichous to rarely secund, sessile to short pedicellate, small and inconspicuous, usually pale to yellow. Sepals convolute, asymmetric and broadest towards the apex, not more than 15 mm long, free to rarely short connate at base. Petals free, naked, more

or less spreading, shorter than to longer than the sepals. Stamens and pistil always included in the petals, sometimes deeply so. Filaments free, sometimes adnate to the petals. Ovary completely superior, glabrous. Style subsessile to short and stout, shorter than the ovary. Capsule septicidal, dehiscent. Seeds erect, basally appendaged with a white, pappiform coma.

#### DUBIOUS TAXA

The following species probably belong in *Racinaea*, but, since we were unable to examine the types, and the descriptions did not include the relevant generic characters, they are impossible to place in *Racinaea* at this time.

*Tillandsia almeriae* Rauh, *Trop. und Subtrop. Pflanz.* 58:19-21, fig. 10. 1986.

*Tillandsia domingosmartinis* Rauh, *Trop. und Subtrop. Pflanz.* 79:17-18, fig. 8. 1991.

*Tillandsia haugii* Rauh, *Trop. und Subtrop. Pflanz.* 52:46-53. figs. 28-30. 1985.

## ACKNOWLEDGMENTS

We would like to thank Dan Nicolson and John Wurdack for their help with the Latin, Harold Robinson and Stephen Smith for reviewing the manuscript, and Leslie Brothers, Jason Grant, and Mark Strong for their valuable comments and suggestions.
