

Pyrus communis subsp. caucasica

| | |
|----------------------------------|--|
| Výška | 15 - 20 m |
| Koruna | elongated to ovoid, variable, half-open crown |
| Kůra a větve | trunk dark grey, deeply grooved, twigs greenish brown |
| List | oval to elliptical or round, glossy dark green, 4 - 8 cm |
| Květy | white, in bundles, April |
| Plody | yellowish brown small pears, approx. 4 - 12 cm, edible fruits |
| Trny | Ano |
| Jedovatost | obvykle není jedovaté pro lidi, (větší) zvířata |
| Typ půdy | neutral to calcareous, preferably dry |
| Půdní vlhkost | vhodné pro suché půdy |
| Zadláždění | tolerující zadláždění |
| Zóna otužilosti | 5a (-28,8 do -26,1 °C) |
| Odolnost větru | good, also on the coast |
| Ostatní odolnost | odolné mrazu (WH 1-6), odolné větru |
| Stromy pro zvířata a hmyz | odolné mrazu (WH 1-6), odolné větru, plodící potravu pro ptáky |
| Použití | dvorky |
| Původ | Caucasus |
| Synonymum | Pyrus caucasica |

A tree with a variable manner of growth that usually develops a narrow, ovoid crown. Height approx. 15 - 20 m, width approx. 10 m. Old trees have a trunk that is dark grey, and sometimes practically black. Usually deeply grooved and sometimes flaking off in small bits. Young twigs start out slightly hairy but are soon bare. They turn greyish brown and sometimes have thorns. The leaves are very variable in shape. They are round, oval or elliptical and glossy dark green, the edges are sharply serrated. White flowers bloom profusely in late April. The flowers, approx. 4 cm in diameter, grow in bundles of 5 to 9 together. Edible, fairly tasteless pear-shaped fruits follow in the autumn. Demands neutral to calcareous soil and is resistant to dryness.
